# **Report of the Fourth Meeting of the Scientific Working Group on Neritic Tuna Stock Assessment in the Southeast Asian Waters**

Royale Chulan Hotel, Bukit Bintang, Kuala Lumpur, Malaysia  
7-9 November 2017

---

## **I. Introduction**

1. The 4<sup>th</sup> Meeting of the Scientific Working Group (SWG) on Neritic Tuna Stock Assessment in Southeast Asian Waters was convened at Royale Chulan Hotel, Bukit Bintang, Kuala Lumpur, Malaysia from 7 to 9 November 2017. The Meeting attended by the experts/scientist and researchers from seven (7) Member Countries namely: Brunei Darussalam, Cambodia, Indonesia, Malaysia, Philippines, Thailand and Viet Nam. Representatives and officers from SEAFDEC/Marine Fisheries Resources Development and Management Department (MFRDMD), SEAFDEC/Training Department (TD) and SEAFDEC/Secretariat (Sec) as well as resource persons from Japan had also attended this meeting. The list of participants appears as **Annex 1**.

## **II. Opening of the Meeting**

2. The meeting was officially opened by the Chief of SEAFDEC/MFRDMD, *Mr. Raja Bidin Raja Hassan*. He welcomed the participants to the meeting and informed the Meeting will also be conducted with a special course by Resource Person, Dr. Nishida. He hoped that all the participants can get as much valuable input during these four (4) days meeting. His Opening Remarks appears as **Annex 2**.

## **III. Introduction and Adoption of the Agenda**

3. *Ms. Noorul Azliana Jamaludin*, Research Officer from SEAFDEC/MFRDMD gave a brief background of the establishment of SWG-Neritic Tunas. The objectives of the Meeting were updated the activities recommended by the 3<sup>rd</sup> SWG on neritic tuna, updated the results of Longtail tuna (LOT) and Kawakawa (KAW) stock and risk assessment, review and discuss on the seer fish stock and risk assessment and workplan and update the genetic study for LOT and KAW. The Meeting also discuss on the management measures and capacity building requirement to improve stock assessment at country level and transfer risk assessment method to scientists who attend the training. Her presentation appears as **Annex 3**.

4. The meeting adopted the agenda unanimously. (**Annex 4**).

## **IV. Review/progress on Stock Assessment of Neritic Tunas including Seer fishes by country and SEAFDEC**

- **Country report**

- i. Brunei Darussalam*

5. *Mr. Muhammad Adam Ramlee* presented the updated status of Neritic Tunas of Brunei Darussalam, including fishing areas used, trend of purse seine fisheries, statistical data, issues and problems and way forward on Neritic Tunas stock

management at national and regional level (**Annex 5**). He also highlighted the inadequacy of capacity building on fish stock assessment especially on the neritic tunas at national level.

6. During the discussion, *Mr. Adam* had informed the meeting that only purse seine had operated to catch the neritic tuna at zone 2 and 3. He also explained that the drop of landing for 21% starting from 2013 was due to decreasing of resource during data collection. According to the report presented also the representatives from Brunei Darussalam explained the possibility of the migration season of the neritic tuna could be a reason why there was no data available during January to February. The meeting was also informed that Brunei Darussalam also had the landing data information for seer fish from 2001 to 2010 but data it will be updated for stock assessment analysis.

7. The meeting commented that the changed catch trends could also be affected by seasonal and migratory pattern of fish as well.

*ii. Cambodia*

8. *Mr. Suy Serywath* presented the status of marine fisheries in Cambodia, seer fish production and some other additional information such as coral reef seagrass and mangroves. Catches of LOT and KAW had decreased by 30-50% compared to the last years. Most of the catches are by BECA gill net in the period from May to November with peak period from July to October and the proportion of catch for LOT was 60% and KAW was 40%. The data is only based on research data since adequate landing data is not available. The validity of the results is therefore uncertain. Catch statistics data for seer fish also previous to 2012 are also available but earlier data are not separated per species and are therefore less useful. His presentation appears as in **Annex 6**.

9. *Dr. Nishida* required the old statistical catch data series of seer fish (older than 2012) from Brunei Darussalam and Cambodia to observing the trend in long time series which both will be update later. In response, the data from Cambodia was not separated by species for seer fish which the data should be clarified later.

*iii. Indonesia*

10. *Mr. Achmad Zamroni* reported on the updated status and trends of neritic tunas in Indonesia (**Annex 7**). The catch trends for neritic tunas landing by purse seine has been increasing starting from 2010. Most of the neritic tunas in Indonesia waters are caught by purse seine and for the small scale fishery in gillnets. KAW had contributed 18% and LOT 12% from the marine fish production in Pemangkat operated by both gears. Mackerel were also presented. Besides, additional information such as current stock of pelagic species and genetic study conducted in Indonesia were also reported in his presentation.

11. *Dr. Nishida* suggested that the king mackerel and seer fish statistics which should include all seer fish species. The national analysis of neritic tuna are interesting but since the stock structure extends outside Indonesian waters they should be viewed as snap shot assessment and are not appropriate for long time assessment as Maximum Sustainable Yield (MSY). The Total Allowable Catch (TAC) data processing which the

Electronic Length Frequency Analysis (ELEFAN) and FAO-ICLARM Stock Assessment tools (FiSAT) can be used for these analyses.

*iv. Malaysia*

12. *Mr. Sallehudin Jamon* presented the current and updated status of Neritic Tunas and seer fish in Malaysia (**Annex 8**). There are landing data of neritic tuna from 1990 to 2016. The landings show a decreasing trend from 2002 to 2005 after which there has been an increase until 2014. Neritic tunas in Malaysia are commonly caught by purse seine, trawl, hand line and driftnet as well as by using Fish Aggregating Device (FADs) and light luring techniques. In 2016, Neritic tuna and seer fish contribute to Malaysia's marine fish landings by 4.7% and 1.1% respectively. There are no landing data separated by species for seer fish.

13. However, neritic tunas had appeared to be stabilized from 2010 to 2014. Data for landings of neritic tunas are also available for different areas. The total landing of seer fish was also highlighted in this presentation besides the analysis of data on CPUE of LOT, KAW and seer fish for Malaysia. It was also indicated the need of strengthen the capacity and regularize research programs and at the same time research collaboration as a management strategies for tuna. However, the Statistical data system also needs to be strengthening to ensure the quality of data collection. The effective management measures also need to consider the ecosystem impact and also the governance and management roles need to be developed and implemented for effective tune fishery management.

14. The meeting commented that the data collection for seer fish should be improved. It was also proposed that the number of FADs in Malaysian water may need to be managed better to balance the catch of neritic tuna and seer fish. The need to specify species for neritic tuna and seer fish was also highlighted and SEAFDEC/TD offered to help in improving the data collection.

*v. Philippines*

15. *Ms. Grace V. Lopez* and *Ms. Sherryl Mesa* presented the current status of the Philippine Neritic Tunas and Seer Fish (**Annex 9 and 10**). The trend in landings of neritic tuna and Bullet tuna were increased from 2012 to 2016 especially *Auxid rochei* and *Auxis thazard*. The data of neritic tuna and seer fish in the Philippines was gathered by National Stock Assessment Program (NSAP). For Seer fish data collection that included CPUE did not start until 2014 and data on trends are therefore not yet available.

*vi. Thailand*

16. *Ms. Praulai Nootmorn* presented the Status of Neritic Tunas Fisheries in Thailand. Based on landing data and CPUE data between 1980 and 2015, Long-tail Tuna and Kawakawa are overfished in the Gulf of Thailand. This was based on a Virtual Population Analyses (VPA) and length at age data. The likely reason for the overfishing is due to catches of small sized neritic tuna using FADs and Luring Purse Seine (LPS). However effort regulation measures are being implemented to improve the stock status. Her presentation as appears in **Annex 11**.

vii. *Viet Nam*

17. *Mr. Bach Van Hanh* presented on the Neritic Tunas Fisheries in Viet Nam Waters (**Annex 12**). frigate tuna, bullet tuna KAW and LOT was also reported in his presentation. There is presently no specific legal framework for neritic tunas fisheries management. However, the Fisheries Law and Decree could be used to develop management tools for neritic tuna fisheries. Nevertheless, the representative from Viet Nam then stated the technical matters happened to the particularly fishery in Viet Nam such as overfishing capacity besides data for stock assessment and the problems such as database is not well handling and frequently updated that need to be concern. Presently Viet Nam has problems with over capacity and there are also technical issues with databases on catch data. For seer fish there is no data collection.

18. A general discussion on the need to take the stock structure into account when the MSY and stock status is calculated as well as on the need for good input data was held. The result from the last SWG meeting showed that spawning stock biomass (SSB) for Kawakawa was in the green zone but close to MSY in Indian Ocean but much higher and in green zone in Pacific Ocean waters. Long-tail Tuna in the Indian Ocean are in the red zone and close to MSY while in Pacific Ocean this species was estimated to be in green zone and above MSY point.

19. Presently these species have been assumed to have two stocks, one in the Indian ocean and one on the South China sea/Pacific. Although this may change in the future any assessments of the MSY must be based on the stock structure even if national/regional assessments can be done to get a snapshot assessment of the regional situation.

20. Other than that, *Dr. Nishida* also informed that the stock assessment on seer fish also will be started in the next two years. Therefore all the member countries should be ready with the input data on the particular species from this time. He also suggested that the target reference point could be based on FISAT analysis while the indicator was based on management point as the starting tools for the analysis at this point.

21. At the moment the quality of the data is a very limiting factor for the possibilities to estimate stock status. The meeting agreed that improvements of catch data separated to species level and including both landing data and CPUE data should be prioritized. It was also proposed that the SWG could produce a document for the country administrations, listing the most immediate needs to improve data quality for stock assessments.

## **V. Review/progress of the Genetic Study and Improve Data Collection**

22. *Ms. Wahidah Mohd Arshaad* from SEAFDEC/MFRDMD presented the Preliminary result of population study of LOT in Southeast Asia waters (**Annex 13**). The aim of the study is to examine the stock structure of Long-tail Tuna (LOT) but samples for Kawakawa have also been collected from the same sites. The stock structure is important for how the species should be managed in the future. The preliminary result is based on 200 samples of LOT from four locations namely Kuala Perlis, Kuantan from Malaysia, Sihanouk Ville from Cambodia and Vung Tau from Viet Nam. The samples have been analyzed using mtDNA D-loop gene. The result

so far indicates that LOT consists of one single stock in the whole area. Samples for both species from some locations are still pending. Samples from Kota Kinabalu represent South China Sea and Semporna Sulu Sea as an out-group are currently being collected within the available budget. The available result for the Gulf of Thailand and the Andaman Sea are though very consistent and likely to stand also after additional samples. The table below indicates the status for the remaining samples to be collected according to the original plan:

No.	Country	Number of samples	
		LOT	KAW
1.	Brunei Darussalam	30	40
2.	Indonesia	0	0
3.	Myanmar	0	0
4.	Philippines	0	50 (From SCS)* 50 (From SS)**

\*SCS = South China Sea

\*\*SS = Sulu Sea

23. *In* the discussion, it was recommended that some additional samples from the west coast of Thailand were collected and also that the results should be compared to the genetic result from Philippines if available. The meeting also agreed that the samples from Myanmar should be collected to get more data from the Andaman Sea.

24. IOTC are presently collecting samples on genetics of neritic tuna in the Indian Ocean and the program has funding that IOTC member countries can apply for. Collaboration with IOTC On analyses and possibly funding could be fruitful for all involved.

## **VI. Apply the Stock and Risk Assessment of LOT and KAW to sub-region Management measures**

25. The Chairman for this session, *Mr. Abdul Razak Latun*, Special Departmental Coordinator from SEAFDEC/MFRDMD had given the introduction about the overview of regional framework for SA of neritic tuna in the region. In this discussion, *Mr. Isara C.* from SEAFDEC/TD stated that to the important for the Working Group to know the global situation on same stock structure. He suggested using Risk Assessment method instead of Stock Assessment method. However, the global picture for each country need to be determined since each country has its own measure for example the established country such as Philippines that using indicator based as a tool for fishery management.

26. The representative from Thailand agreed that on method which proposed by *Dr. Nishida* to be used the neritic tunas stock in this region for assessment. While Chief of SEAFDEC/MFRDMD also added to asses this stock as globally since it was a common shared stock in this region.

27. *Dr. Nishida* reported so far only bot sub-regional for Thailand had the CPUE data and he encouraged the other country to give the input data for the assessment purpose. He also suggested for the SWG to come out with Standard Operating Procedure (SOP) for the establishment of stock assessment. And he also suggested

adding the accumulation for biology data in future beside ASPIC analysis result. The Chief of SEAFDEC/MFRDMD recommended doing a major assessment by using comprehensive data. He suggested the age structure analysis also could be analyzed besides length structure input data. Perhaps if the result was same, the management strategy could be started and can be proposed for ASEAN meeting for management on neritic tuna in the region.

28. However, SWG need to be standardized and finalized to use the best method for stock assessment of neritic tunas in the region as been suggested by *Dr. Jacob Hagberg*. Currently, as mentioned by *Dr. Nishida* the used of CPUE as the data input for Thailand has been applied. However, the other tools such as ASPIC method also need to be considered. The SWG need to consider of each country situation before decide the method will be used for assessment such as Viet Nam had reported that in their country, the catch of neritic tunas was not a target species therefore, the use of CPUE analysis was difficult to applied therefore Viet Nam preferred the use of ASPIC and Risk Assessment method to use for the neritic tunas assessment. The representative from Philippines also reported their time series of data was not consistent if the effort was applied as needed in the analysis. Therefore, the quality of input data by each country need to be reviewed so that the idea of neritic tunas management at ASEAN level can be conclusive and comprehensive as stated by Malaysia's representative. The Malaysia's representative also suggested that the updated analysis should be done in every two years. Therefore, recognizing the situation faced by most of the country regarding the non-targeted species of neritic tunas, *Dr. Jacob Hagberg* suggested optimizing the method so that the assessment of neritic tunas in the region can be fully used.

29. *Mr. Isara C.* from SEAFDEC/TD suggested on the regional management for neritic tuna in Gulf of Thailand (GoT) Sub-region should be focused on the social economic aspect in order to apply the environmental management in the in the region as well. While Chief of SEAFDEC/MFRDMD suggested on the study of economy also could be included and this also agreed by Malaysia's representative.

30. In addition, the representative from Malaysia also suggested that fishing gear development could also be applied in future. This also been supported by Brunei Darussalam to starts with the implementation of mesh size could be done. SEAFDEC/TD had reported that the survey of fishing gears has been done in 2014 that focused on neritic tunas and purse seine net mesh size. However, this suggestion could be least priority as stated by Chief of MFRDMD as he advised to focus on up-dated data to be analyses therefore can be used for management strategy (*e.g.* to reduce the fishing effort). The compilation of data and with latest information from SEAFDEC could be a major exercise to pre-determine the neritic tunas stock in the region.

31. *Dr. Nishida* inform the meeting that there are the "Data massage process" and standardize of CPUE using generalize linear model which the uncertainties could be got rid of a lot. The assessment time every 2 years was too fast, the current level of region cannot obtain this rapid assessment. The period of monitoring should be depended on situations, the red stock should have monitored as often as possible but the yellow or green can take longer time.

32. The Meeting was informed that the FADs management issue was raised in order to manage the tuna and other pelagic resource and Malaysia request SEAFDEC to study on this.

33. The representative from the Philippines required the clarifications on the type of effort used for calculation in the entire process. In response, *Dr. Nishida* clarified that the exact unit of effort cannot answer yet depends on the detail and trend of effort which was different in each countries and area, this issue should be discussed later.

34. The representative from Thailand *Mr. Amnuay Kongprom* provided the concept on “*The effort reducing management measure simulating data by Thai DoF*” this concept is to using the percentage of overfishing for separate to each country by that percentage that can be converted to catch. That catch could be referred to each country by ratio of regional catch by country, which each country could be calculate back to the national effort using their own standard CPUE. The effort they can be separated by gear by their own national data which the management measure will be decided by country themselves.

35. *Dr. Jacob Hagberg* provided that another possible way is to control the catch by country by using the CPUE trend. The management measure of catch reduction or other necessary options can be implemented when trend of CPUE is declining as precautionary approach. This choice seems to be appropriated for both socio-economic based management and biological based management as well.

## **VII. Reviews on preparatory work on Stock and Risk Assessment of Seer Fish in the Southeast Asia by Dr Tom Nishida**

36. *Dr. Nishida* presented a Review on Stock and Risk Assessment of Seer fish and work plan (**Annex 14**). In this session, he showed the progress work that has been done for LOT and KAW under this program. He also informed that currently the IOTC also had been working under same species therefore he pointed that the need of collaboration with IOTC and the extra budget was needed under this purpose. Again he also informed the meeting that the assessment for neritic tunas in the region will be continued in addition with seer fishes. During the discussion, representative from Philippines reminds the countries that the data collection of seer fish have to be collected according to the species before the stock assessment of the seer fish could be done.

## **VIII. Reviews other activities and work plan for Research, Capacity Building and Priorities for 2018 and onward**

- **Role of SWG**

37. The meeting discussed how the Terms of Reference for SWG, which had been endorsed by the SEAFDEC Council Meeting should be followed up. Recognizing the important of landing control logbook system, *Dr. Jacob Hagberg* suggested for SEAFDEC to develop Monitoring, Control and Surveillance (MCS) system for monitoring and control as been applied to Gulf of Thailand. He also suggested suggest on the data requirement step for more clarification and gathering as much data as we can, including the fishery, monitoring and managing and biological data. The logbook

data was also required to be included for more precise information and The data gathering should be included the data of other species that have possibility to do the assessment in the future as a good process for future work.

38. *Dr. Nishida* had emphasized all the SWG members the important of input data for CPUE for stock assessment using ASPIC analysis. Besides the biological data also could be added in the analysis. Perhaps this also could be a good exercise for preparation on stock assessment for seer fishes in next two year. Therefore, a follow up action on data compilation and mining according to country requirement was needed. A few of suggestions had been raised in order to upgrading the data collection such as:

- i) Some collaboration with statistics working group for data compilation and data mining.
- ii) A specific program for more detail information on data collection.
- iii) A development of Working Group for data collection.
- iv) A technical support for country with poor data collection.

39. The representative from Malaysia, *Mr. Samsudin Basir* suggested should be set a timing for the result of stock assessment to be forwarded to the higher level at the same year so that the advice could be taken.

- **Work plan for research and capacity building**

40. The representative from Cambodia expressed the interest on capacity building and will try their best to contribute in stock assessment for neritic tunas and also seer fishes in future. Therefore, the meeting understand the need of capacity building especially on species identification and data analysis for country such as Cambodia, therefore further discussion on budget was needed especially when involve with high value species like seer fishes. The meeting was also agreed that a special workshop for data standardization was needed for data collection. Therefore, it was suggested that this workshop schedule in third week of April 2018.

- **Next SWG-Neritic Tunas Meeting**

41. The meeting had agreed that the next SWG meeting will be hosted by Indonesia and the meeting was proposed at first week of October or November 2018.

## **IX. Introduction: Risk Assessments for Neritic Tunas in Southeast Asia**

42. *Dr. Nishida* was presented the Introduction for Risk Assessments for Neritic Tunas in Southeast Asia as in **Annex 15**. He had reviewed the last course conducted in 2016 and his plan for the course that been conducted back to back with this SWG meeting. He also reported the information or result from stock assessment conducted for LOT and KAW in Indian Ocean waters under IOTC program.

43. During the discussion, the representative from Thailand requested some information paper for reference due to 30% reduce of total landing was proposed in Indian Ocean based from the risk assessment analysis done.

44. The representative from Malaysia suggested the SWG secretariat to consider the framework on the activity for SWG to insert the matter of emergency to re-analyse the

stock assessment on LOT in 2018. He also added this issue also as one of the major concern during IOTC meeting.

45. The Chief of SEAFDEC/MFRDMD had emphasized the important of learning the software analysis for stock and risk assessment so that all the countries can work on their own data analysis for their own assessment in future.

46. Some participants of the meeting wished to perform a reassessment of LOT in 2018. However the general opinion was that the current estimate was still valid and there were no plans or resources to update the data and reassess during 2018 which instead will be dedicated to Seer fish (King Mackerel).

#### **X. Risk Assessments for Neritic Tunas in Southeast Asia**

47. During the last day of the meeting *Dr. Nishida* held a training course on risk assessments of Neritic tuna. This Training was the second phase of the training conducted as proposed by the hosted by SEAFDEC/MFRDMD. One person from each participating country was invited to attend the course which was considered a “Training the Trainer course”. The participants were required to make a report on risk assessment after the course.

#### **XI. Closing of the Meeting**

48. The Chief of SEAFDEC/MFRDMD, *Mr. Raja Bidin Raja Hassan* had expressed his sincere gratitude to all the participants who had spent four days to discuss stock assessment of neritic tunas in Southeast Asian waters. He was pleased that meeting had been able to obtain valuable outputs for management measures. He conveyed his thanks to all the participants, resource person and secretariat of the meeting for their hard work and contribution during the meeting. With that note, he declared 4<sup>th</sup> Meeting of the SWG on Neritic Tuna Stock Assessment in the Southeast Asian Waters closed. His closing remarks appeared in **Annex 16**.

**List of Participants**

**Brunei Darussalam**

**Matzaini Haji Juna**  
Acting Senior Fisheries Officer

## Opening Remarks

*By Chief of SEAFDEC/MFRDMD  
Mr. Raja Bidin Raja Hassan*

Assalamualaikum WBT and very good morning,  
Dr Tom Nishida, Our resource person from Japan,  
Dr Kenji Taki, Deputy Chief of SEAFDEC/MFRDMD,  
Members of Scientific Working Group on Neritic Tuna  
Senior Officers from Secretariat, TD and MFRDMD  
Observers,

Ladies and Gentlemen:

Welcome to our Scientific Working Group Meeting on neritic tuna stock assessment and advance training course on risk assessment of longtail tuna and kawakawa in the Southeast Asian waters.

It is indeed a great pleasure for me to welcome all of you to our meeting and special training program on Longtail Tuna and Kawakawa in Southeast Asia jointly organized by SEAFDEC/MFRDMD in collaboration with SEAFDEC/Sec.

This is the fourth series of SWG meetings organized by SEAFDEC since 2014. The first meeting was held in Malaysia, the second meeting in Thailand, the third meeting in Vietnam and the fourth meeting back to Kuala Lumpur. According to our original plan, this meeting should be in Manila, however due to unforeseen circumstances, this meeting is back to Malaysia.

I hope during 2 days meeting here, we could compile the latest information from member countries about your follow-up activities related to data collection and your data analyses based on our previous training program. I hope we could introduce more interesting findings that useful for management of neritic tuna species in the South China Sea and Andaman Sea waters.

We are going to spend two days for SWG meeting and another one more day for our special training. Today, I am very happy that Dr Tom Nishida, our resource person from Japan, could be with us after was advised to rest following an operation early this year.

Therefore I am really hope that our participants will participate actively during the meeting and training program, so that you are able to benefit most from Dr Tom present.

Ladies and gentlemen

Neritic tuna is not only a good local commodity, however increasingly important for international markets, especially in Europe and US. Therefore regional cooperation is required to promote the sustainable utilization of neritic tuna in Southeast Asia.

It is anticipated that the participants will enhance their knowledge on risk assessment which also important for management of these species. This training has been designed to be practical with lectures, examples and exercises to provide skills, encourage participation and exchange information among participants. Therefore, these meeting and training program will provide us not only essential knowledge but also a great opportunity to share experiences both technical and regulatory issues on Risk Assessments and Fisheries Management Framework/Measures of our targeted species.

Lastly, I would like to take this opportunity to express our sincere thanks to the organizing committee and in particular our honorable resource person Dr Tom Nishida. I wish this meeting and training program are useful, interesting and beneficial for our future works and hope you have a pleasant stay in Kuala Lumpur.

Finally, in the name of Allah, the most Gracious and Merciful, I would like to declare our SWG Meeting and **Training on Longtail Tuna and Kawakawa in Southeast Asia**” officially open.

Thank you.

Introduction of the Meeting by Ms. Noorul Azliana Jamaludin

4th Meeting of Scientific Working Group on Neritic Tunas Stock Assessment and Advance Training Course on Risk Assessments of Longtail Tuna and Kowloka in the Southeast Asian Waters  
Kuala Lumpur, Malaysia

## Introduction of Agenda

- Background
- SWG-Neritic Tunas
- Meeting agenda
- 4th SWG
- Time table

## Background

1. SEAFDEC was assigned to develop a regional cooperation focusing on neritic tuna fisheries during the 45th Meeting of the SEAFDEC Council in April 2013.
2. The Regional Plan of Action (RPOA) for sustainable neritic tuna fisheries and management was developed during the Experts Group Meeting in Krabi, Thailand, in June 2014.
3. One of the important activities was to establish the SWG on neritic tuna stock assessment.

4th Meeting of Scientific Working Group on Neritic Tunas Stock Assessment and Advance Training Course on Risk Assessments of Longtail Tuna and Kowloka in the Southeast Asian Waters  
Kuala Lumpur, Malaysia

## Introduction of Agenda

- Background
- SWG-Neritic Tunas
- Meeting agenda
- 4th SWG
- Time table

## SWG-Neritic Tunas

1. The 1st SWG - Neritic Tunas - 18 to 20 Nov 2014 (Shah Alam, Malaysia) collaboration with DoF Malaysia.
2. The 2nd SWG- Neritic Tunas - 15 to 17 June 2015 (Hai Phong, Viet Nam) collaboration with D-Fish, Viet Nam
3. The 3rd SWG-Neritic Tunas - 27 to 29 June 2017 (Chonburi Province, Thailand) collaboration with SEAFDEC/Sec

- 1st SWG
- 2nd SWG
- 3rd SWG
- Capacity building

## 1st SWG

Objectives:

1. Reviewed the updating status and trends of neritic tuna fisheries in the SEA especially LOT.
2. Drafting Terms of Reference (TOR) for long term establishment of the working group.
3. Discussed the work plan for data improvement and requirement of the capacity building.

## 2nd SWG

Objectives:

1. Updated on RPOA - Neritic tunas and TOR for SWG- Neritic tunas.
2. Discussed on work-plan for genetic study and stock assessment of LOT and KAW based on the country existing data.
3. Discussed the prioritization of capacity building program particularly on Stock Assessment.

## 3rd SWG

Objectives:

1. Reviewed the progress result on LOT and KAW stock assessment and work plan for genetic study
2. Reviewed paper of biology and ecology of neritic tuna as well as technical/policy recommendations
3. proposed management measures for consideration by country

## Capacity building

1. Due to country requested capacity buildings on CPUE standardization, stock assessments (SA) and management procedures based on SA result.
2. The special Training/Workshop on SA of LOT and KAW in the SEA region was held 17 - 25 April 2016 in Kuala Terengganu, Malaysia.
3. Based on the outstanding response for the first phase training, the second training was requested hosted by MFRDMD in collaboration with SEAFDEC/Sec was conducted in Kuala Terengganu 6 to 10 August 2017.

4th Meeting of Scientific Working Group on Neritic Tunas Stock Assessment and Advance Training Course on Risk Assessments of Longtail Tuna and Kawakawa in The Southeast Asian Waters  
Kuala Lumpur, Malaysia

# Introduction of Agenda

Background SWG-Neritic Tunas Meeting agenda 4th SWG Time table

## 4th SWG

Objectives:

1. To update the activities recommended by the 3rd SWG on neritic tuna SA
2. To update on the results of LOT and KAW stock and Risk assessment
3. To review and discuss on the seer fishes stock and risk assessment and work plan
4. To discuss and update the genetic study for LOT and KAW
5. To discuss on the management measures on the adopted policy recommendations from the LOT and KAW stock assessment and capacity building requirement to improve SA at country level
6. To transfer risk assessment methods to scientists who attended the first training course on the stock assessments using ASPIC (April, 2016)

Expected output

## Expected output

1. The management measures based on the 2016 LOT and KAW stock and risk assessments
2. Updated information on the stock structure of LOT and KAW in the region based on genetic result for management measures
3. Gain knowledge and skills on risk assessments methods, especially for Longtail tuna and Kawakawa in the Southeast Asia
4. Updated information on the seer fishes stock assessment and work plan
5. Transfer risk assessment methods to national scientists for capacity building requirement

4th Meeting of Scientific Working Group on Neritic Tunas Stock Assessment and Advance Training Course on Risk Assessments of Longtail Tuna and Kawakawa in The Southeast Asian Waters  
Kuala Lumpur, Malaysia

# Introduction of Agenda

Background SWG-Neritic Tunas Meeting agenda 4th SWG Time table

## Meeting agenda

- Agenda 1 - Opening of the meeting
- Agenda 2 - Introduction and Adaption of the agenda
- Agenda 3 - Review/progress on Stock Assessment of Neritic Tunas including Seer fishes by country
- Agenda 4 - Review/progress of the Genetic Study and Improve Data Collection
- Agenda 5 - Apply the Stock and Risk Assessment of LOT and KAW to sub-region Management measures
- Agenda 6 - Reviews on preparatory work on Stock and Risk Assessment of Seer Fish in the Southeast Asia
- Agenda 7 - Reviews other activities and work plan for Research, Capacity Building and Priorities for 2018 and onward

## 7 Nov 2017

08 November 2017 (Tuesday): Day 1	
08:30-09:00	Registration
09:00-09:30	Agenda 1: Opening of the Meeting
09:30-09:45	Welcome Remarks and Opening of the meeting by Chief of SEAFFO/MFRDMD - Mr. Raju Balin Raja (Hindi)
09:45-09:55	Introduction of the agenda (Ms. Noorul Aslina Binti Jamali)
Agenda 2: Review/progress on Stock Assessment of Neritic Tunas including Seer fishes by country (Chairperson: Chief of MFRDMD)	
09:55-10:05	National country report by Brunei Darussalam
10:05-10:15	Other meeting coffee break
10:15-10:35	National country report by Cambodia
10:35-10:45	National country report by Indonesia
10:45-11:15	National country report by Malaysia
11:15-11:35	National country report by Myanmar
11:35-11:55	National country report by Philippines
11:55-12:15	National country report by Thailand
12:15-12:35	National country report by Viet Nam
12:35-13:00	Lunch
13:00-13:00	General discussion on review progress on Stock Assessment of Neritic Tunas including seer fishes by country and SEAFFO
Agenda 4: Review/progress of the Genetic Study and Improve Data Collection (Chairperson: SAC of SEAFFO/MFRDMD - Mr. Abdul Rauf Latiff)	
13:00-13:20	Preliminary result of population study of LOT in Southeast Asia waters - MFRDMD
13:20-13:30	Tea break
13:30-13:30	Other matter

8 Nov 2017

9 Nov 2017

## 8 Nov 2017

09 November 2017 (Wednesday): Day 2	
Agenda 5: Apply the Stock and Risk Assessment of LOT and KAW to sub-region Management measures (Chairperson: SAC of SEAFFO/MFRDMD)	
09:00-10:00	Discussion on the application of the Results on SA and Risk Assessment to Sub-regional management practices
10:00-11:20	Yes break
Agenda 6: Reviews on preparatory work on Stock and Risk Assessment of Seer Fish in the Southeast Asia by Dr. Tam Nohida (Chairperson: Chief of MFRDMD)	
11:20-12:10	Reviews on Stock and Risk Assessment of Seer fish and work plan (Dr. T. Nohida)
12:30-14:00	Lunch break
Agenda 7: Reviews other activities and work plan for Research, Capacity Building and Priorities for 2018 and onward (Chairperson: Chief of MFRDMD)	
14:00-15:00	Review/discussion on: <ul style="list-style-type: none"> <li>Neritic tunas database and website</li> <li>Role of scientific Working Group</li> <li>Role of Secretariat of the SWG</li> <li>Work plan for research and capacity building</li> <li>Next SWG Neritic Tunas Meeting</li> <li>Others</li> </ul>
15:00-15:30	Coffee break
Introduction: Risk Assessments for Neritic Tunas in Southeast Asia	
15:30-17:00	Review of the last course and Introduction to Risk assessments (Dr. T. Nohida)

9 Nov 2017

9 <sup>th</sup> August 2017 (Thursday): Day 3	
<b>Practical Session : Risk Assessments for Neritic Tunas in Southeast Asia</b>	
0900-1020	Practical session: Risk assessment on Longtail tuna and Kawakawa (Participants)
1020-1040	<Coffee break>
1040-1300	<continue practical session>
1300-1400	<Lunch>
1400-1530	<continue practical session>
1530-1545	<Coffee break>
1545-1715	<continue practical session>
1715-1730	Closing of the meeting and training by Chief of MFRDMD

4th Meeting of Scientific Working Group on Neritic Tunas Risk Assessment and Advance Training Course on Risk Assessments of Longtail Tuna and Kawakawa in the Southeast Asian Waters  
Kuala Lumpur, Malaysia

## Agenda

### **Agenda 1: Opening of the Meeting**

### **Agenda 2: Introduction and Adoption of the Agenda**

### **Agenda 3: Review/progress on Stock Assessment of Neritic Tunas including Seer fishes by country and SEAFDEC**

- National country report
  - i. Cambodia
  - ii. Indonesia
  - iii. Malaysia
  - iv. Myanmar
  - v. Philippines
  - vi. Thailand
  - vii. Viet Nam
  
- General discussion on review/progress on Stock Assessment of Neritic Tunas including seer fishes by country and SEAFDEC

### **Agenda 4: Review/progress of the Genetic Study and Improve Data Collection**

### **Agenda 5: Apply the Stock and Risk Assessment of LOT and KAW to sub-region Management measures**

### **Agenda 6: Reviews on preparatory work on Stock and Risk Assessment of Seer Fish in the Southeast Asia by Dr Tom Nishida**

### **Agenda 7: Reviews other activities and work plan for Research, Capacity Building and Priorities for 2018 and onward**

- Neritic tunas database and website
- Role of scientific Working Group
- Role of Secretariat of the SWG
- Work plan for research and capacity building
- Next SWG-Neritic Tunas Meeting

### **Agenda 8: Introduction: Risk Assessments for Neritic Tunas in Southeast Asia**

### **Agenda 9: Practical Session: Risk Assessments for Neritic Tunas in Southeast Asia**

### **Agenda 10: Closing of the Meeting**

Country Profile: Brunei Darussalam by *Mr. Muhammad Adam Ramlee*

## NERITIC TUNAS FISHERIES

### BRUNEI DARUSSALAM

COUNTRY REPORT BY:  
MATZAINI HAJI JUNA  
MUHAMMAD ADAM RAMLEE

### Introduction

- ▶ Brunei Darussalam is located in the northwestern part of Borneo with an area of 5,765km<sup>2</sup> and 161 km long coastline fronting South China Sea.
- ▶ The total marine territorial area is estimated about 41,188 km<sup>2</sup> covering the Brunei Fisheries Limits with the potential yield of about 21,300 metric tons.

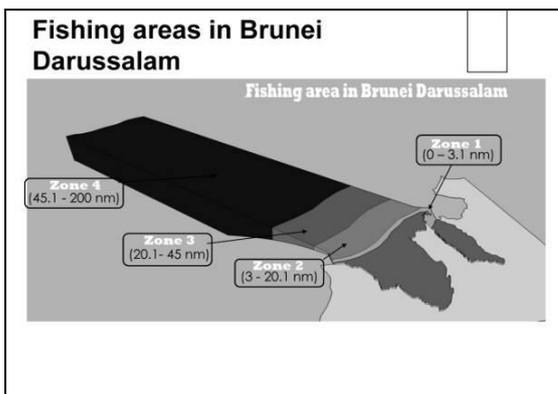

### Introduction...

- ▶ Neritic tunas (also called coastal tuna) are very important species group for commercial coastal fishing and / or the small-scale fisheries of most nations including Brunei Darussalam.
- ▶ The neritic tunas in Brunei Darussalam is very much affected by its neighboring countries since neritic or coastal tunas are highly and moderated migratory species.
- ▶ Stock assessment of neritic tunas is not as easy as demersal resources because of the wider area of coverage of this migratory species.
- ▶ Therefore it is highly recommended that Brunei actively participate in the RPOA neritic tuna which will involve capacity building and stock assessment in the region.

### Neritic Tunas Species Found in Brunei Darussalam Waters

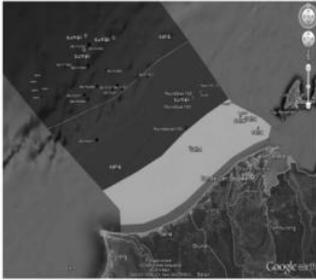

English Name	Scientific Name
Longtail Tuna	<i>Thunnus tonggol</i>
Frigate Tuna	<i>Auxis thazard</i>
Bullet Tuna	<i>Auxis rochei</i>
Kawakawa	<i>Euthynnus affinis</i>
Narrow-barred Spanish mackerel	<i>Scomberomorus commerson</i>
Indo-pacific king mackerel	<i>Scomberomorus guttatus</i>

### FISHING GEARS SPECIFICATION BY ZONE IN BRUNEI DARUSSALAM

Zone 1 (0-3.1 nm)	Zone 2 (3-20.1 nm)	Zone 3 (20.1-45 nm)	Zone 4 (45-200 nm)
<b>Small Scale Fisheries (outboard engine)</b> VESSEL & ENGINE SPECIFICATION Vessel: <50 GT Color: Orange (red) / Blue Engine: < 200 HP	<b>VESSEL &amp; ENGINE SPECIFICATION</b> Vessel: 40 GT - 150 GT Color: Yellow / Red Engine: 201-400 HP	<b>VESSEL &amp; ENGINE SPECIFICATION</b> Vessel: 150 GT - 200 GT Color: Red / Yellow/Blue Engine: 500-800 HP	<b>VESSEL &amp; ENGINE SPECIFICATION</b> Vessel: 150 GT - 200 GT Color: Red / Yellow/Blue Engine: 500-800 HP
<b>LONGLINE TRAP &amp; HANDLINE</b> Hook: 3/0 Max 200 hooks per vessel Max Long: 2 km <b>PURSE SEINE</b> Net: 200m Mesh: 30mm Max Long: 400 meter <b>TRAWLER</b> Net: 200m Mesh: 15mm	<b>LONGLINE TRAP &amp; HANDLINE</b> Hook: 3/0 Max 200 hooks per vessel Max Long: 4 km <b>PURSE SEINE</b> Net: 200m Mesh: 30mm Max Long: 400 meter Net: 200m Mesh: 30mm Max Long: 400 meter <b>TRAWLER</b> Net: 200m Mesh: 15mm	<b>PURSE SEINE</b> Net: 200m Mesh: 30mm Max Long: 400 meter <b>LONGLINE TUNA</b> Hook: 3/0 Max 200 hooks per vessel Max Long: 4 km <b>TUNA PURSE SEINE</b> Net: 200m Mesh: 30mm Max Length: 800 meter	<b>PURSE SEINE</b> Net: 200m Mesh: 30mm Max Long: 400 meter <b>LONGLINE TUNA</b> Hook: 3/0 Max 200 hooks per vessel Max Long: 4 km <b>TUNA PURSE SEINE</b> Net: 200m Mesh: 30mm Max Length: 800 meter

### Fishing Area of Purse Seine Fishery (fishing area)

- ▶ The picture shows the fishing area of commercial purse seiners according to respective companies registered in Brunei Darussalam where their FADs are being deployed.
- ▶ Mostly zone 2, 3 and 4 are areas of purse seiner in Brunei Darussalam.

### FADs areas for purse seiners

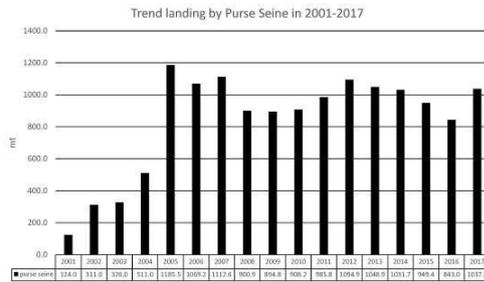

- ▢ FADs areas
- FADs deployed by purse seiners are located at zone 1, 2 and 3.
- Traditional FADs for small scale fishermen are deployed near the shore in zone 1 and 2

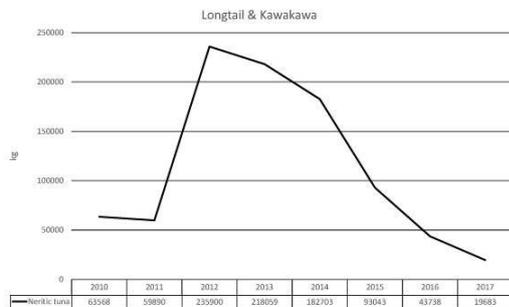

### Utilization of Neritic Tunas

- ▶ Important to Brunei Darussalam as it is the main source of protein provider to the people of Brunei Darussalam.
- ▶ Most fish is consumed as fresh.
- ▶ Processed to tuna loin, smoked fish, fish burger and other processing products.

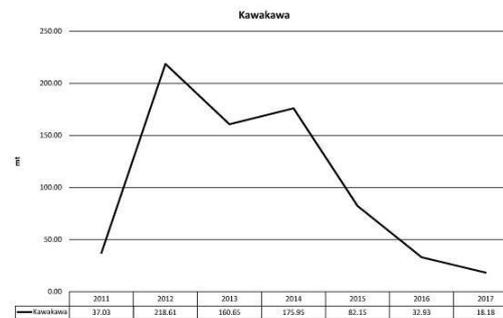

### TREND OF PURSE SEINE FISHERIES BRUNEI DARUSSALAM (mt)

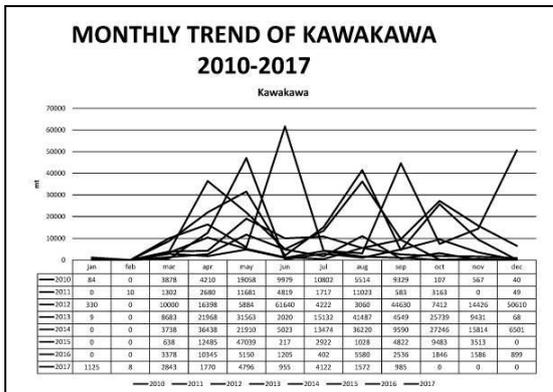

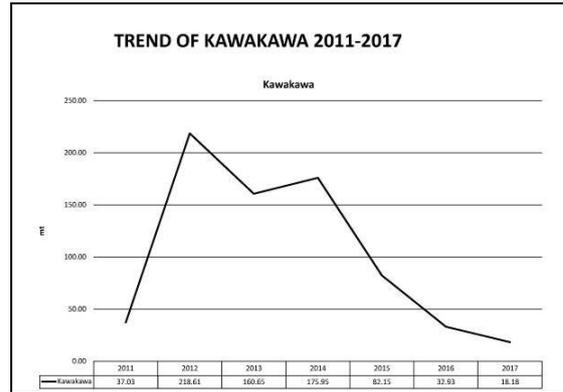

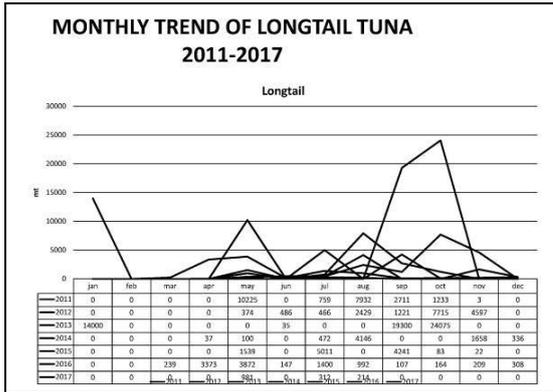

### TREND OF LONGTAIL TUNA AND KAWAKAWA 2010-2017

### TREND OF KAWAKAWA 2011-2017

### NERITIC TUNA STATISTIC DATA (KG)

Brunei Darussalam's Coastal Area  
Up to 200 nautical miles from shore of Brunei Darussalam: Zone 1 - 4

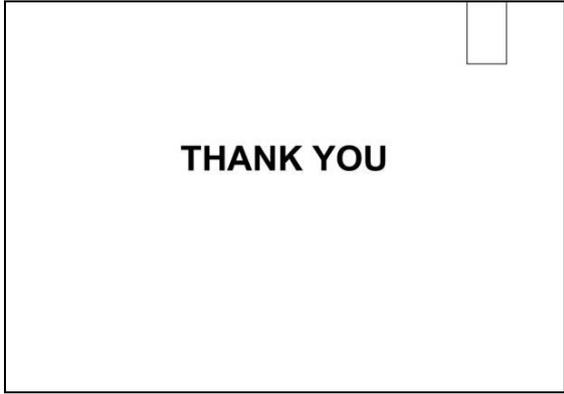

Fish Species	2010	2011	2012	2013	2014	2015	2016	GRAND TOTAL

<b>TOTAL</b>	<b>105784</b>	<b>129720</b>	<b>349454</b>	<b>314312</b>	<b>234152</b>	<b>129469</b>	<b>64683</b>	<b>1313483</b>

### ISSUES AND PROBLEMS

- ▶ The main issue that needs to be addressed is the overfishing and over capacity problem causing the decline in neritic tuna resources.
- ▶ Lack of updated fish stock assessment among others that will be tackled in the RPOA process.
- ▶ Need more capacity building on the neritic tuna / tuna stock assessment analysis.

### Way Forward

- ▶ Joint partner with the operator on identification of the pelagic species, reducing the error on the data.
- ▶ Work with them on research work on length weight relationship, and Gonad Somatic Index (GSI) will be start NEXT YEAR FOR TWO YEARS PROJECT
- ▶ Working on NPOA pelagic fisheries that included neritic tunas.
- ▶ Limiting numbers of licenses, based on MSY of the gears.
- ▶ Regulation of mesh size for purse seines, by zoning.
- ▶ Transfer knowledge to other officers and staffs of Department of Fisheries on the analysis of neritic tuna.

Country Profile: Cambodia by *Mr. Suy Serywath*

4<sup>th</sup> Meeting of Scientific Working Group on Neritic Tunas Stock Assessment and Advance Training Course on Risk Assessment of Longtail Tuna And Kawa Kawa in the Southeast Asian Waters  
7-9 November 2017  
Kuala Lumpur, Malaysia

**Marine Fisheries In Cambodia**

The Marine Fisheries Research and Development Institute/Administration, Cambodia  
November 2017  
Prepared by: *Suy Serywath*

**Outline**

- ▶ The general information
- ▶ Marine capture fisheries
- ▶ Seer fish production
- ▶ Coral reef seagrass and mangroves
- ▶ Observation on longtail tuna and Kawa

**General information**

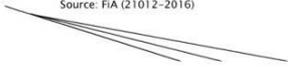

- ▶ There are 435 km coast line covered 4 provinces (Koh Kong, Preah Sihanouk and Kep)
- ▶ The Exclusive Economic Zone (EEZ) covers approximately 55 600 km<sup>2</sup> and
- ▶ An average depth of about 50 metres.

**Marine Capture production**

Year	Total catch (tons)	Marine fish (tons)	%
2012	608,000	99,000	16.28
2013	638,000	110,000	17.24
2014	625,255	120,250	19.23
2015	608,405	120,500	19.81
2016	629,950	120,600	19.14

Source: FIA (21012-2016)

**Seer fish production**

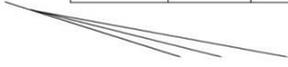

Year	Marine fish (tons)	Seer fish (tons)	%
2012	99,000	1,234	1.25
2013	110,000	1,286	1.17
2014	120,250	1,485	1.23
2015	120,500	1,506	1.25
2016	120,600	1,539	1.28

Source: FIA (2012-2016)

<b>Total</b>	<b>2,805</b>	<b>31,947</b>	<b>1,005</b>

### Observation/information on longtail tuna and Kawa kawa

- › Catch period of long tail tuna and kawa kawa was conducted from May to November and fishing gears is BECA gill net
- › The peak period of catching longtail tuna and Kawa kawa is July to October, and more fish capture production when there are strong wind or storm occurred at off shore
- › An area of capture these two species at 30 miles is from coastal and around islands
- › The recoding on longtail tuna and kawa kawa during DNA sampling (50 heads of each species)
  - Longtail tuna: Length (305mm-440mm) and average length is 381mm  
Weight (370g-1,180g) and average weight is 774g
  - Kawa Kawa: Length (285mm-428mm) and average length is 381mm  
Weight (340g-1200g) and average weight is 742g

### Remark from fisherman on longtail tuna and kawa kawa

- › The proportion of production
  - Longtail tuna is around 60%
  - Kawa Kawa is around 40%
- › The production is decrease around 30-50% comparing with last few years
- › There are strong wind and storm occurred several time in this year, however, fisherman could not catch these species
- › The number of fisherman is decreasing year by year.

*Thank you very much*

Country Profile: Indonesia by Mr. Achmad Zamroni

### Neritic Tuna Fishery in Indonesia

Agency for Marine and Fisheries Research and Human Resources Development  
Center for Fisheries Research

### Indonesia FMAs

Indonesia is an archipelagic nation located between the continents of Asia and Australia surrounded by two oceans, Pacific Ocean in the northern part and Indian Ocean in southern part. It consists of approximately 17,508 islands and a coast line of 81,000 km.

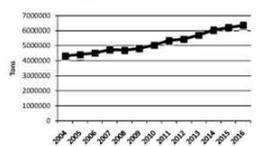

Totally, Indonesia has 5.8 million km<sup>2</sup> of marine waters consisting of 3.1 million km<sup>2</sup> of territorial waters (<12 miles) and 2.7 million km<sup>2</sup> of EEZ (12-200 miles).

For fisheries management purpose Indonesia waters are divided into eleven Fisheries Management Areas (FMAs) (Figure 1).

### Marine Production

Total marine production in 2016 → 6,351,480 tons, in 2015 total → 6,200,468 tons

Indonesia Fisheries production dominated by small pelagic (32%), large pelagic (23%), and demersal fish group (24%).

Group Species	tons	%
Small Pelagic	2,015,002.00	32.48
Large Pelagic	1,476,872.00	23.80
Demersal	1,534,404.00	24.73
Coral fish	289,892.00	4.67
Crustacean	405,934.00	6.54
Others	482,554.00	7.78
Total	6,204,668.00	

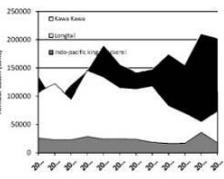

### Fleet Structure and Fishing Gear

- Total vessel in 2014 → 625,633 units, dominated by small scale fisheries with < 10 GT vessel size
- Total fishing gear in 2014 → 1,141,809 units with the hooks and line (37%), gillnets (27.5%), traps (12%) seine nets (11.3%) → purse seine only 2.3%

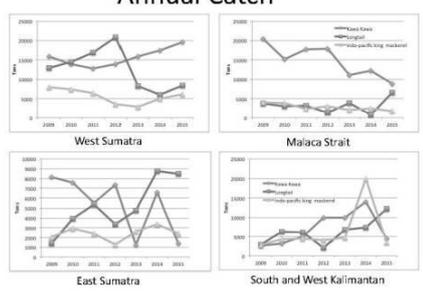

Category	Units	Units	%	Fishing gear group	units	%
Non Powered Boat	165,066	266,512	93.6%	Surrounding nets (include PS)	23,225	2.03
Out board Motor	153,491	597,043		Seine nets	127,091	11.13
< 5 GT	41,374			Trawl	18,993	1.66
5-10 GT	14,305			Gill net	34,307	3.00
10-20 GT	5,578			Gillnets and Entangling Nets	314,500	27.54
20-30 GT	1,291			Traps	139,274	12.20
30-50 GT	1,765			hooks and lines	423,925	37.13
50-100 GT	841			others	80,494	5.30
100-200 GT	176			Total	1,141,809	
>200 GT	176					
Total	625,633	27,690	4.8%			

### Indonesian Tuna Neritic

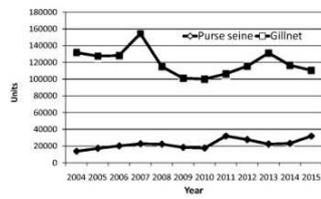

- There are 6 species of neritic tuna and seer fishes in Indonesia waters. The six species are kawakawa (*Euthynnus affinis*), longtail tuna (*Thunnus tonggol*), frigate tuna (*Axius thazard*), bullet tuna (*Axius rachei*), narrow-barred Spanish mackerel (*Scomberomorus commerson*) and Indo-Pacific king mackerel (*Scomberomorus guttatus*).
- Kawa-kawa (*Euthynnus affinis*) and Longtail tuna (*Thunnus tonggol*) are pelagic fish that have economic value in Indonesian fisheries.
- Indo-Pacific king mackerel (*Scomberomorus guttatus*), Kawa-kawa (*Euthynnus affinis*) and Longtail tuna (*Thunnus tonggol*) contribute 293,643 tons (4.6% national marine prod.).

## Country Profile: Malaysia by *Mr. Sallehudin Jamon*

### Neritic Tuna Fishery in Malaysia

Tuna Stock Assessment and Advance Training  
Course on Risk Assessments of Longtail Tuna  
Kawakawa in the Southeast Asian Waters  
Kuala Lumpur Malaysia

Sallehudin Jamon  
Fisheries Research Institute- Kampung Acheh  
32000 Sitiawan Perak

### INTRODUCTION

Malaysia is a maritime nation, surrounded by five seas;

- i Straits of Malacca,
- ii Andaman Sea
- iii South China Sea, and
- iv Sulu Sea and
- v Celebes Sea

### Marine fishing areas in Malaysia

- Peninsular Malaysia,  
West coast (Malacca Straits) and Andaman Sea  
East coast (South China Sea)
- Sarawak  
South China Sea
- Sabah waters  
South China Sea on the west coast  
Sulu and Celebes Seas in the east coast.

The Malacca Straits is part of the IOTC area of competence, and The Malaysian EEZ in the Malacca Straits is adjacent to Indonesia in the west and to Thailand in the north

### Marine fish productions

- Total catch of marine fish from Malaysian waters in 2016 were 1.57 million mt, a slide increased 6% compared to 1.48 million in 2015
- The total landing in 2016 were attributed to the catch from 56,111 registered vessels with trawlers, purse seines, drift nets contributed large percentage of the catches
- In 2016, marine fish production from the west coast of Peninsular Malaysia (Malacca Straits) contribute 813,758 mt (51.8%) out of the total catch. The remaining catches were from the South China Sea and Sulu Celebes Seas, east coast of Sabah
- Coastal fisheries produced 76% (1,195,359 mt) and 24% (377,481 mt) from offshore fisheries
- The government develop tuna fisheries not only in coastal waters, but also in offshore waters within the Exclusive Economic Zone (EEZ).
- Tuna fisheries, which include both oceanic and neritic tuna,
- The second strategic development plan for tuna fisheries was launched at the end of 2013.

- In Malaysia, neritic tunas and seer were exploited by variety of fishing gears –  
purse seine, trawl, hand line and drift net.
- In 1987, when purse seiner were introduced to catching the neritic tunas and start from that the landing of neritic tuna were increased.
- At present fishing gears and techniques to catch were developed by using Fish Aggregating Device (FADs) and light luring techniques

- In 2016, Neritic tuna and seer fish contribute more 4.7% and 1.1% of Malaysia's marine fish landings respectively
- Purse seines are the most important fishing gear in neritic tuna fisheries, especially the 40-69.9 GRT and >70 GRT vessel size. It contributed more than 82% of the annual catches of neritic tuna in Malaysia.
- In WCPM, Drift net is the most important fishing gear to catch seer fish, followed by trawl net.
- ECPM- handline, Labuan – Drift net, Sabah – Pure seine and Sawarak – Trawl net

## Exploitation of Neritic Tuna

longtail Tuna (*Thunnus tonggol*)  
(Aya Hitam)

kawakawa (*Euthynnus affinis*)  
(Aya Kurik)

frigate tuna (*Auxis thazard*)  
(Aya Selasih)

- Neritic tuna consists of
  - longtail tuna (*Thunnus tonggol*),
  - kawakawa (*Euthynnus affinis*) and
  - frigate tuna (*Auxis thazard* and *Auxis rochei*).
- In 2016, Neritic tuna contributed 4.7% (69,780.31 mt of the total marine landings with the value more than USD4.8 billion

## Seer Fish

Spotted Spanish Mackerel  
(Ikan Tenggiri Fijian)  
*Scomberomorus guttatus*

- Sigmatulus*
- Trawl net/DN/HL/PS
- Drift Net
- Handline

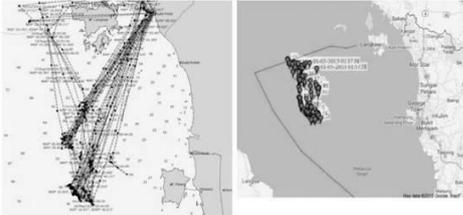

Barred Spanish Mackerel  
(Ikan Tenggiri Batang)  
*Scomberomorus commerson*

- S.commerson*
- Coastal area
- WCPM
- Drift Net/DN/HL/PS
- Handline

No breakdown by species in annual fisheries statistic

## Fishing Area WCPM (Perlis)

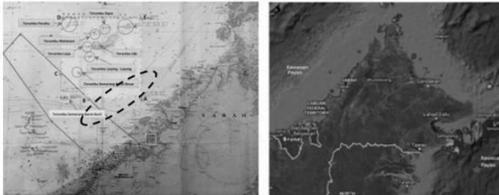

- The neritic tuna catches by purse seine with capacity >70 GRT usually operates on more than 30 bn from the beach
- Most areas with sufficient depth is located in the northern part of west Peninsular Malaysia.

## Fishing area ECPM (Kelantan)

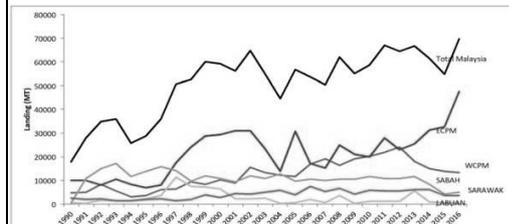

## Fishing area Sabah

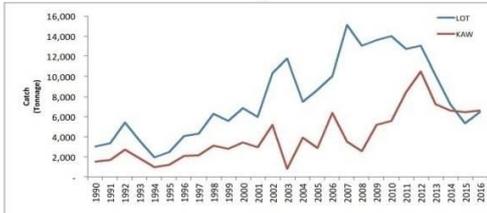

- Potential area in west Sabah
- FADs – depth areas for fishing

## Total landings of neritic tuna in Malaysia -Annual Fisheries statistic DoFM

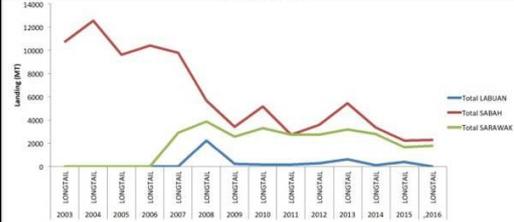

- Landings in Malaysia ranged from 40,000 mt to 65,000 mt.
- The highest catch - 2013 and 2002 ( 68,000 mt and 62,000 mt)
- Decreasing trend - 2002 to 2005 before an increasing trend until 2014
- Landings of neritic tuna in Malaysia appear to have stabilized from 2010 to 2014.
- Total annual production in Sarawak, Sabah & Labuan 26,839 Mt (1997) and 3172 Mt (1990)
- ECPM & WCPM annual production 50,000 Mt (2011) and 11,000 (1995)

### Total landings of LOT & KAW in Pen Malaysia

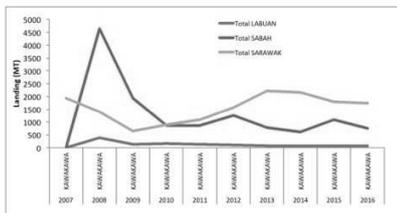

- Parallel trend – total landing in ECPM & WCPM
- The highest catch LOT in 2007 (15,000 mt)
- Increasing trend from 1990 -2012 and decreasing in 2012 until 2014
- The highest catch KAW 2012 (10,000 mt) and than start to decreasing until 2016

### Landings of LOT Sarawak, Sabah & Labuan

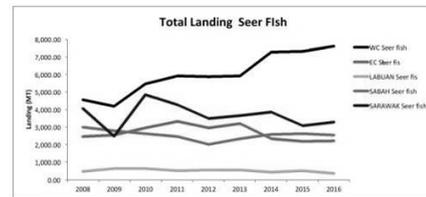

- Sarawak- Landing stable 2003- 2016 (2,900 -1,600 MT)
- Labuan – The highest landing in 2008 (2200 MT)

### Total landings of KAW Sarawak, Sabah & Labuan

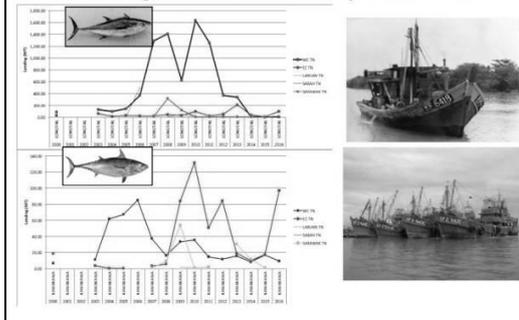

- Sabah – Decreasing trend 2008- 2016 (4,600 – 615 MT)
- Sarawak –Increasing trend 2009-2016 (646 – 2,200 MT)
- Labuan – Decreasing trend 2008 -2016 (400- 64 MT)

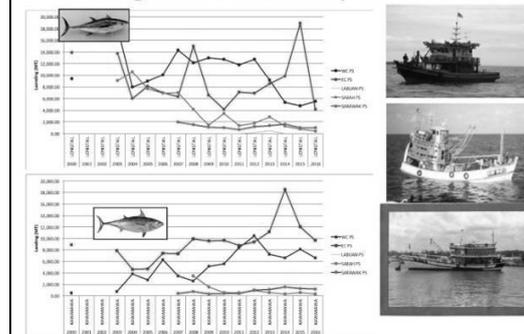

### Total Landing of seer fish in Malaysia

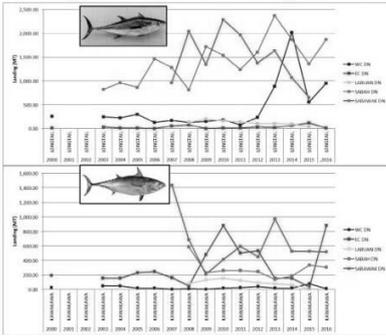

### Landing of LOT & KAW by Trawl net

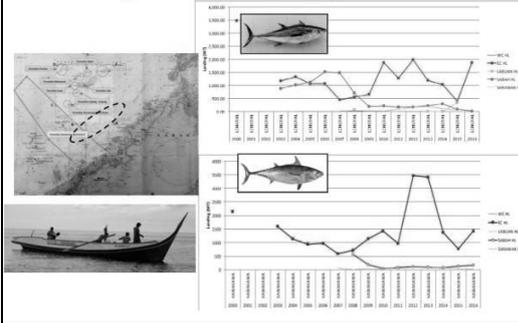

### Landing of LOT & KAW by Purse seine

### Landing of LOT & KAW by Drift net

### Landing of LOT & KAW by Hand & line

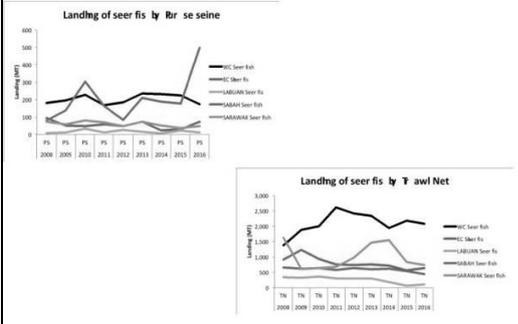

### GROWTH PARAMETERS & EXPLOITATION RATE

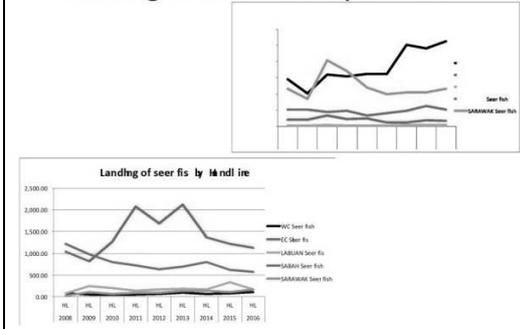

Table 3 Growth parameters of kawakawa, longtail tuna and frigate tuna in Kuala Perlis and Tok Bali

Species	Common name	Location	L <sub>∞</sub> (mm)	K	Ø	Z	M	F	E
<i>Euthynnus affinis</i>	Kawakawa	Kuala Perlis	604.28	0.26	4.98	0.80	0.33	0.47	0.59
		Tok Bali	530.78	0.19	4.73	0.49	0.28	0.21	0.43
<i>Auxis thazard</i>	Frigate tuna	Kuala Perlis	436.28	0.33	4.80	1.24	0.42	0.82	0.66
		Tok Bali	457.28	0.34	4.85	0.92	0.43	0.49	0.54
<i>Thunnus tonggol</i>	Longtail tuna	Kuala Perlis	520.28	0.93	5.40	2.49	0.79	2.15	0.73

### Landing of Seer Fish by PS & TN

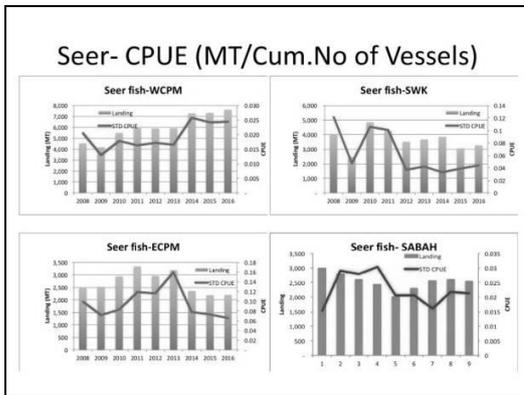

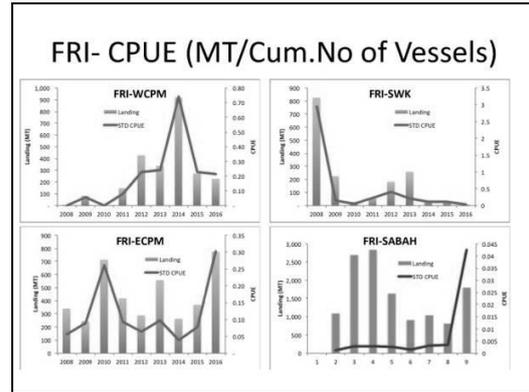

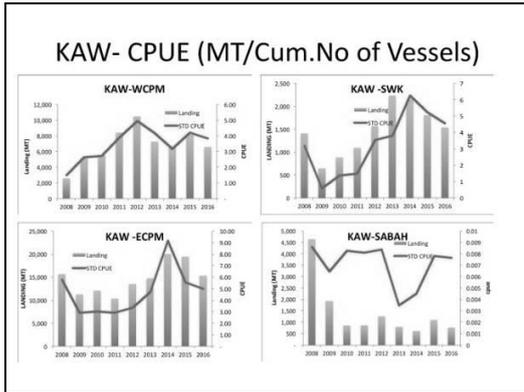

### Landing of Seer Fish by DN & HL

### LOT- CPUE (MT/Cum.No of Vessels)

## Management strategies for tuna (Recommendations)

**1. Stock Status**

- A precautionary approach is recommended to avoid the stocks from reaching over-fished levels based on the following:
  - Strengthen capacity and regularize research programs for stock assessment, biology and population structure of each tuna species within Malaysia waters.
  - Research collaboration with foreign research institutions and regional IRFMO.
  - Strengthening of tuna fishery statistical data collection system by:
    - Adequate and well trained staff to ensure quality data collection.
    - Deployment of observers onboard fishing vessels for quality catch data by species and fishing effort data.
- Implementing logbook system for all purse seine operators to provide catch and fishing information which is mandatory to merit the renewal of their annual vessels and fishing gears license. Specify what capacity.

**2. Ecosystem Impacts**

- There is a need to introduce effective management measures to protect retained species and ETP animals. This is to address the impact related to the use of light and FADs in the purse seine fishery on retained species (juvenile fish) and ETP animals (marine mammals).

**3. Governance and Management**

- Develop and implement neritic tuna fisheries management plan.
- Develop guidelines and regulations on installation of FADs in Malaysian waters.
- Establish gear specifications for tuna purse seine
- Strengthen enforcement to combat IUU fishing - transhipment at sea and illegal catch landing in foreign port.

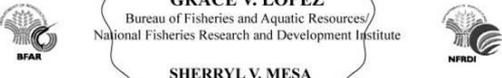

## CONCLUSIONS

- The neritic tuna fishery is very much related to the purse seine fishing gears. There is a question of harvesting small pelagic fish including neritic tuna in the South China Sea and Sulu & Celebes Sea, to what level of the fishing efforts that the present neritic tuna can sustain the exploitation rate.
- There should be a level of exploitation rate set by the fisheries manager as to ensure that the present resources are exploited at a sustainable level and with a responsible manner.
- The shared stock need shared management among the bordering countries. To implement an effective shared stock management, it needs systematic cooperation and coordination between the ASEAN countries. With the ASEAN Member, SEAFDEC can play the role as a platform to coordinate and assist the member countries in research program, managing and streamline data collection format and conducting relevant capacity buildings
- For Malaysia, there is still room to improve the quality of catch and efforts data. With a good data quality, it will provide a good input for scientist to estimate the status of small pelagic fish stocks and at the end it will also assist the fisheries manager in planning and sustainable development of the purse seine fishery.

TERIMA KASIH

Country Profile: Philippines Part I by Ms. Grace V. Lopez

4<sup>th</sup> SWG Meeting on Neritic Tunas Stock Assessment and  
Advance Training Course on Risk Assessment of LOT and KAW in the SEA  
Waters  
7 – 9 November 2017  
Kuala Lumpur, Malaysia

**OUTLINE:**

- I. INTRODUCTION
  - o Overview of marine capture fisheries
  - o Updated landing data of neritic tunas and seer fishes
  - o Other information (i.e. biology, ecology, stock structure, fisheries & environmental data)
- II. STOCK ASSESSMENT STATUS OF NERITIC TUNAS AND SEER FISHES
  - o Catch and effort
  - o Catch at size
  - o Growth curves and age-length
  - o Catch at age
  - o CPUE indices and standardized data CPUE indices
  - o Tagging data
- III. STOCK ASSESSMENT UPDATES OF NERITIC TUNAS AND SEER FISHES
- IV. OTHER INFORMATION (i. e. ,management strategies, technical advice on the status of neritic tunas and seer fishes)
- V. CONCLUSION

**Overview**

 **The Philippines**

- situated in the western Pacific Ocean,
- categorized into 3 main geographical divisions: Luzon, Visayas, and Mindanao
- consist of more than 7,100 islands and islets
- **Total territorial water area (+EEZ):** 2.2 million km<sup>2</sup>
  - o coastal area: 266,000 km<sup>2</sup>
  - o oceanic area: 1,934,000 km<sup>2</sup>

**Philippine Marine Capture Fisheries**

**Divided into:**

- ❑ Municipal fishing sector (use fishing boats of 3 GT or less, fish within the municipal waters or 15 km from shoreline)
- ❑ Commercial fishing sector (use fishing boats of >3 GT, fish outside the municipal waters beyond 15 km from shoreline)

**3 sub-sectors:**

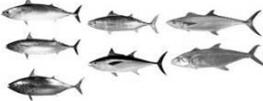

- small scale commercial fishing – use passive or active gear utilizing fishing vessels of 3.1 GT up to 20 GT.
- medium scale commercial fishing - use active gear and vessels of 20.1 GT up to 150 GT.
- large scale commercial - use active gear and vessels of >150 GT.

 **WHERE can we find the activities of NSAP?**

**Data source of neritic tunas and seer fishes:**

- **National Stock Assessment Program (NSAP)** – gather data i.e. landed Catch and effort, length measurements of selected species, reproductive biology of selected species

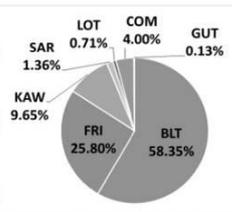

Municipalities covered from NSAP Expansion

Fish landing sites covered

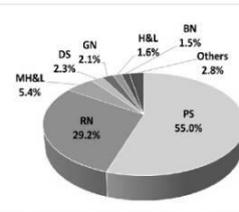

Philippine map showing the distribution of the fish landing sites being monitored by NSAP

**Updated landing data of neritic tunas and seer fishes**

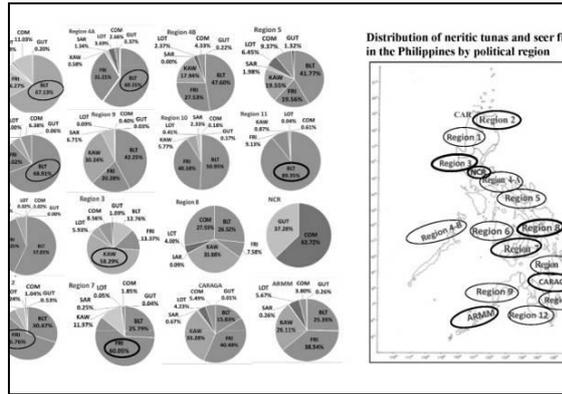

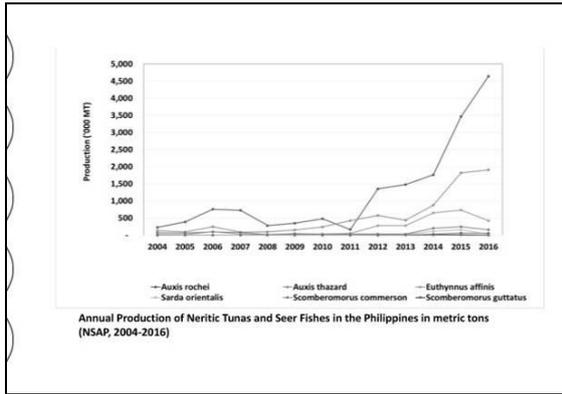

Relative Abundance of Neritic Tunas and Seer Fishes in the Philippines (NSAP data, 2004-2016)

		Euthynnus affinis	0.52
		Average	0.63

**Status of Philippine neritic tunas by fishing ground based on Exploitation values using 2015 length frequency data**

**Limit Reference Point for Exploitation Rate set at E = 0.5**

**Stock Assessment Update:**

**NSAP expansion coverage supported!**

- NSAP Coverage in 1997  
Fishing Grounds Monitored: 15
- NSAP Coverage in all regions started in 2015  
Landing Centers monitored by NSAP: 782
- NSAP Coverage in 2016  
Landing Centers monitored by NSAP: 840  
Fishing Grounds monitored: 58

**Philippine map showing the distribution of the fish landing sites being monitored by NSAP (As of August 2017)**

**Stock Assessment Update:**

**NSAP started reproductive biology study of selected species**

- NSAP in BFAR Region I started reproductive study in 2016 of selected species including the two neritic tunas (*Auxis rochei* and *Auxis thazard*).
- Fishing grounds facing the West Philippine Sea (Ilocos Coast, Lingayen Gulf, and Bangui Bay)

**Other Information**

**A Pilot Study on the Genetic Variation of Eastern Little Tuna (*Euthynnus affinis*) in Southeast Asia (Santos et al., 2010)**

- A first report on the analysis of the genetic variation of *Euthynnus affinis* (Eastern Little Tuna) population in the Philippines and Southeast Asia using mitochondrial DNA control region (D-loop).
- Samples were collected from 1997-1999 in selected landing areas or markets, 35 from the Philippines and 14 from West Coast Malaysia (Penang, Malaysia).
- Initial result showed no genetic heterogeneity detected on the samples collected which showed that this species from the Philippines and in Southeast Asia is near "panmixia" or "mixing".
- further studies in the future using a larger sample size and additional sampling sites in the area e.g. Sulawesi and Papua New Guinea were suggested

## Management strategies

- The management of the Philippine tuna fisheries is primarily governed by the national government through the Department of Agriculture/Bureau of Fisheries and Aquatic Resources (DA/BFAR). It is responsible in the management, conservation, development, protection, utilization, and disposal of all fisheries and aquatic resources **beyond the municipal waters.**
- **Municipal waters is under the jurisdiction of the Local Government Units (LGUs)** composed of the municipal and city government.
- Various management efforts by the **national and local government, private sector and the Non-Government Organizations (NGOs)** help in the management of our fishery resources.

## Fisheries Management

### 3 legal framework of Philippine fisheries sector:

- 1) **Republic Act (RA) 8550 – “The Philippine Fisheries Code of 1998” as amended by RA 10654 – “An Act to Prevent, Deter and Eliminate Illegal, Unreported and Unregulated Fishing”.**
  - the governing law in Philippine fisheries
  - highlights conservation, protection and sustained management of fishery and aquatic resources
- 2) **RA 7160 (Local Government Code of 1991)**
  - devolve the management and regulation of the municipal waters (15 km radius from the shoreline) and its fisheries resources to the **Local Government Units (LGUs).**
- 3) **RA 8435 -The Fisheries Modernization Act of 1997 (AFMA)**
  - is geared towards modernization and industrialization of the fisheries sector by transforming it into a technology-based industry in accordance with the principles of sustainable development.

## National Fishing Regulations (Fishery Administrative Order/FAO)

- FAO 144, s 1983 – Rules and regulations on commercial fishing
- FAO 188, s 1993 - Regulations governing the operation of commercial fishing boats in Philippine waters using tuna purse seine nets
- FAO 198, s 2000 – Rules and regulations on commercial fishing
- FAO 199, s 2000 – Guidelines on fish transshipment
- FAO 201, s 2000 - Ban of fishing with active gear
- FAO 204, s 2000 - Restricting the use of superlights in fishing
- FAO 217, s. 2001 – Obstruction to Defined Migration Paths.
- FAO 223, s 2003 – Moratorium on the issuance of new Commercial Fishing Vessel and Gear License (CFVGL) as part of precautionary approach to fisheries management
- FAO 223-1, s 2003 – Amending Sec. 1 and 2 of FAO 223, s. 2003, re: Moratorium on the issuance of new Commercial Fishing Vessel and Gear License (CFVGL) as part of precautionary approach to fisheries management
- FAO 226, s 2008 – Regulations on the mesh size of tuna purse seine nets and trading of small tunas.

## National Fishing Regulations (Fishery Administrative Order/FAO)

- FAO 236, s 2010 - Rules and regulations on the Operation of Purse Seine and Ring Net Vessels Using FADs locally known as Payaos during the FAD Closure Period as Compatible Measures to WCPFC CMM 2008-01
- FAO 236-1, s 2012 – Extension of FAO 236, s. 2010: Rules and regulations on the Operations of Purse Seine and Ring Net Vessels Using FADs locally known as Payaos during the FAD Closure Period as Compatible Measures to WCPFC CMM 2008-01
- FAO 238, s 2012 - Rules and Regulations Governing the Implementation of Council Regulation (EC) No. 1005/2008 on the Catch Certification Scheme
- FAO 240, s 2012 - Rules and Regulations in the Implementation of Fisheries Observers Program in the High Seas
- FAO 241, s 2012 - Regulations and Implementation of the Vessel Monitoring System (VMS) in the High Seas
- FAO 244 s.2012 - National Tuna Fish Aggregating Device (FAD) Management Policy
- FAO 245 s.2012 - Regulations and Implementing Guidelines on Group Tuna Purse Seine Operations in High Seas Pocket Number 1 as a Special Management Area

## Other Management Measures in Relation to Neritic Tunas and Seer Fishes

- National Tuna Management Plan (cover all forms of municipal and commercial tuna fishing up to the limit of its Exclusive Economic Zone (EEZ))
- National Plan of Action to Deter Illegal, Unreported and Unregulated Fishing (NPOA-IUUF)
- National Tuna Fish Aggregating Device (FAD) Management Policy
- Strategic Action Program for the Sustainable Fisheries Management of the Sulu-Celebes (Sulawesi) Sea Large Marine Ecosystem (SCS-LME).
- Demarcation of Fishery Management Areas (FMA)

## CONCLUSION

The problem of managing the fishery resources that are shared by two or more countries or just within the country like in the Philippines is very complicated especially with the problem of resource depletion or over harvesting being experienced now by the majority of our marine resources. In this case, there is a need for cooperation and collaboration among the member countries for the resources like the neritic tunas and seer fishes to be sustained. Cooperative type of research, management and conservation among the concerned countries should be encouraged. For the Philippines, the data collection including the neritic tunas and seer fishes under the National Stock Assessment Program should be continued annually. Expansion to cover all fishing grounds should be encouraged, if the budget from the Philippine government is possible. Studies to include the reproductive biology, stock structure etc. of these species should be started for a deeper understanding of the biology, structure, migration, etc. of these species.

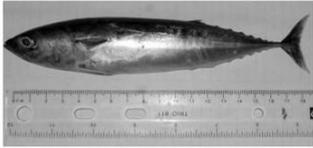

Country Profile: Philippines Part II by Ms. Sherryl Mesa

### Current Status of the Philippine Neritic Tunas and Seer Fishes

II. STOCK ASSESSMENT STATUS OF NERITIC TUNAS AND SEER FISHES

### Stock Status of *Auxis rochei rochei* (Bullet Tuna)

#### FISHE: Framework for Integrated Stock & Habitat Evaluation

- Management regulations based on science even in resource and data limited conditions
- Uses various methods and inputs from stakeholders
- Adaptive process

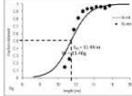

#### NSAP Assessment Methodologies:

$CPUE = \frac{\text{Catch}}{\text{Effort}}$

## HCRs Implementation and Adaptation

Questions	Answer
What are the actual Harvest Control Measures put in place to achieve HCRs	<ul style="list-style-type: none"> <li>- No specific policies for the management of Neritic Tuna in the country</li> <li>- Indirect policies implemented that targets small pelagic fishes but are implemented on Fishing Gear approach (eg. Fishing Closures and FAD Regulations)</li> </ul>

## HCRs Implementation and Adaptation

Questions	Answer
Based on the results from Assessment Steps 2, 4 and 9 is there anything about the fishery that we need to keep in mind that might be impacting our results?	<p>Fishing resource is not an infinite resource</p> <p>Assessment process should always involve the participation of all the stake holders to acquire their knowledge of the resource, as well as their commitment to meet the goal of the sector.</p>

## HCRs Implementation and Adaptation

Questions	Answer
What other things need to be done to help facilitate management?	<ul style="list-style-type: none"> <li>- Establish detailed Scientific Basis on stock status</li> <li>- Temporal and spatial research studies (eg. Simultaneous Reproductive Biology Studies)</li> <li>- Thorough assessment on the status of major neritic tuna in the country</li> </ul>

Country Profile: Thailand by Ms. Praulai Nootmorn

**Stock assessment updates for  
neritic tunas including seer fishes**

Dof of Thailand have studied on the status of neritic tuna in 2012 by applied biological parameters, such as asymptotic length ( $L_{\infty}$ ), growth parameter coefficient (K), total mortality coefficient (Z), natural mortality coefficient (M), fishing mortality coefficient (F) and exploitation ratio (E).

We have also applied the age at size data by length structure virtual population analysis, VPA) followed the methodology of Jones' Length-based Cohort Analyze and length based Thompson and Bell Analysis.

The result found overfishing of kawakawa and longtail tuna in the Gulf of Thailand and Andaman Sea. The cause of overfishing that may be from catch small size of neretic tuna by FADs, LPS during the neretic tuna resources have migration in Thai Waters.

**Others information** (e.g. existing management strategies, technical advice on the status of neritic tunas including seer fishes by country)

Thailand has “the Marine Fisheries Management Plan of Thailand (FMP)” in October 2015. FMP 2015-2019 outlines the nature of the management challenges facing Thailand and details what actions and management measures are required to transform what is now essentially an open-access fishery into a limited-access fishery based on balancing the fishing effort with the productivity of the resources (MSY). FMP of Thailand is closely linked to the National Plan of Action to NPOA-IUU 2015 and the National Plan of Control and Inspection (NPCI) 2015. Thailand will be implemented the e-logbook, e-licencing and Port State Measure (PSM) in 2016 and catch quota og longtail tuna in 2018. Enhance the operational capacity for Port in – Port out control to cover all Thai Waters has conducted since 2015. Thailand started and implemented the VMS system on all fishing vessels (> 30 gross ton) in 2015 and observer programme in 2015 (Department of Fisheries, 2015).

Thailand has ratified the United Nations Fish Stocks Agreement (UNFSA) and agree on Port State Measures (PSM) in 2016 (Department of Fisheries, 2015).

Logbook and port sampling schemes have regularly conducted and calculated total production of neritic tuna in the Gulf of Thailand and the Andaman sea.

Fishing License System and Fisheries Controls by zonation between Gulf of Thailand and Andaman Sea and commercial fishing vessel have code and marking scheme by gross tonnes and type of gears.

The assessment of maximum sustainable yield (MSY) and optimal fishing effort in Thai waters since 2015 to present.

Fishing vessel have code and marking scheme

Thank you

Country Profile: Viet Nam by *Mr. Bach Van Hanh*

 4<sup>th</sup> MEETING OF SCIENTIFIC WORKING GROUP ON NERITIC TUNAS STOCK ASSESSMENT AND ADVANCE TRAINING COURSE ON RISK ASSESSMENTS OF LONG TAILED TUNA AND KAWAKAWA IN THE SOUTHEAST ASIAN WATERS  
 7<sup>th</sup>-9<sup>th</sup> NOVEMBER 2017, KUALA LUMPUR, MALAYSIA

**NERITIC TUNAS FISHERIES  
IN VIETNAM WATERS**

Bach Van Hanh  
 Department of Science, Technology and International Cooperation – Directorate of Fisheries  
 Hoang Ngoc Son  
 Department of Marine Fisheries Resources - Research Institute for Marine Fisheries

**OVERVIEW**

- Vietnam's marine fisheries are largely small-scale, multi-species and multi-gear.
- Land area: 329.560 km<sup>2</sup>
- Coast line: 3.260 km
- EEZ area: 1.000.000 km<sup>2</sup>
- The Sea of Vietnam:
  - Tonkin Gulf (I)
  - Central waters (II)
  - South-eastern waters (III)
  - South-western waters (IV)
  - Offshore (V)
- Marine exploitation: 2.876 thousand tons (↑ 2,21% compared to 2015)

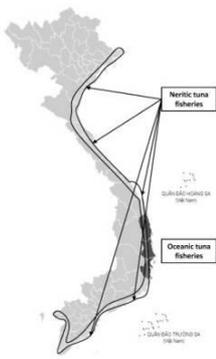

**Tunas Fisheries in Vietnam**

- **Oceanic tuna fisheries:** Binh Dinh, Phu Yen, Khanh Hoa province.
- **Neritic tuna fisheries:** Scattered along coastal provinces, from North to South Vietnam.

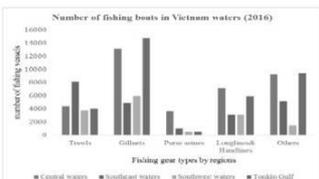

**Fishing gears**

- Longline, Drift-gillnet, Purse seine

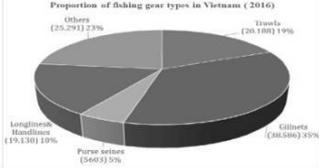

**Fishing vessels and fishing gears in Vietnam**

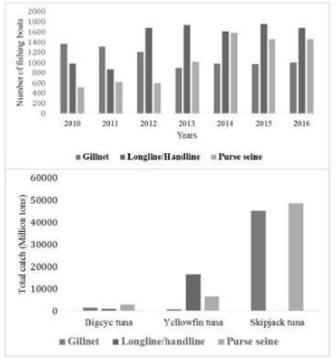

Number of fishing boats in Vietnam waters (2016)

Proportion of fishing gear types in Vietnam (2016)

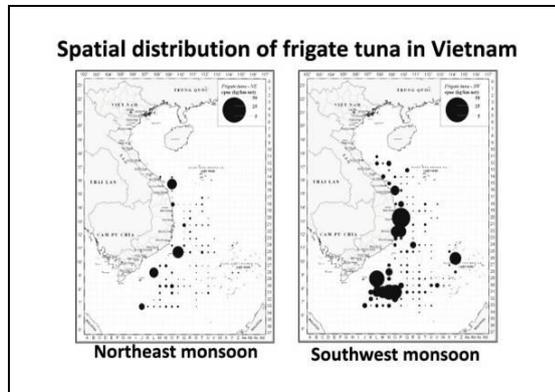

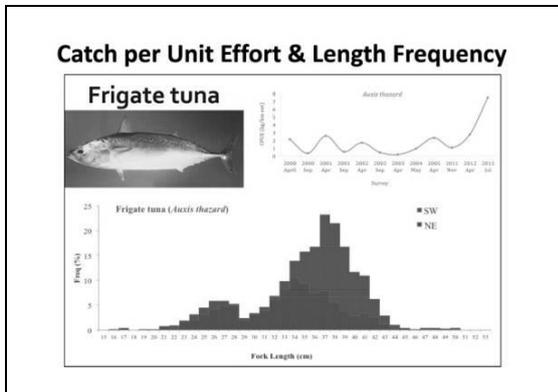

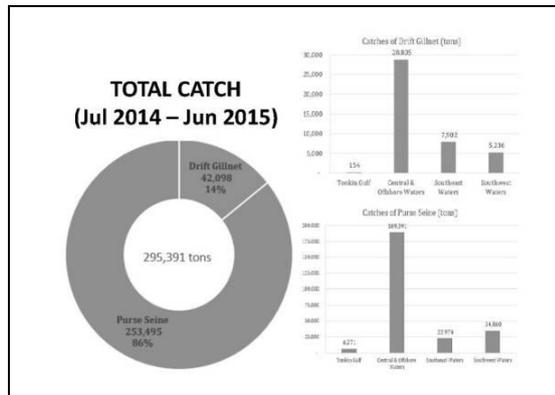

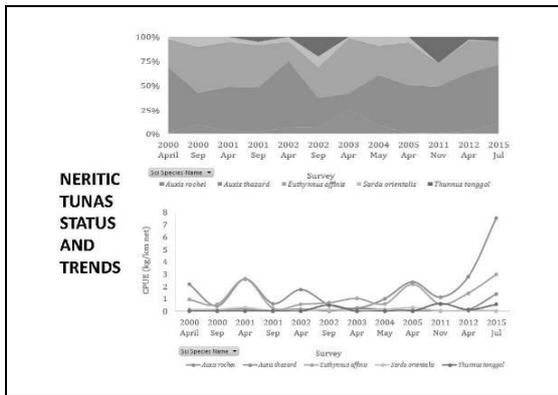

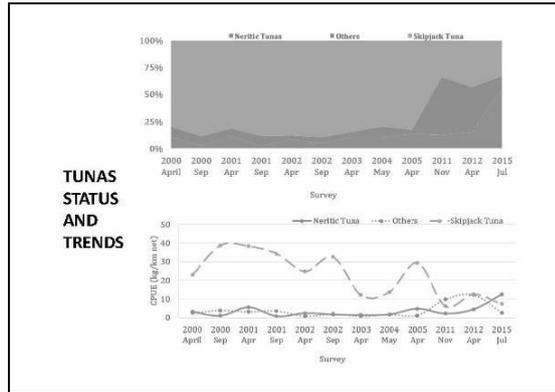

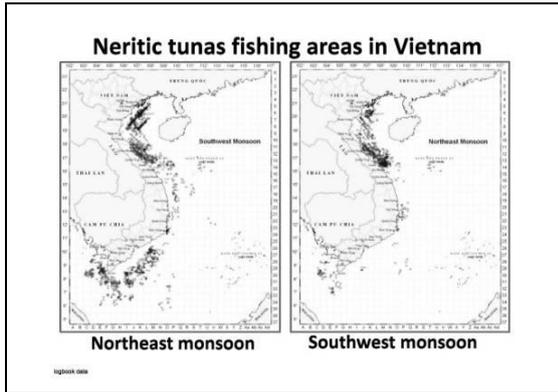

**Oceanic tuna fisheries in Vietnam**

**Neritic tunas in Vietnam waters**

- + Frigate tuna – *Auxis thazard*
- + Bullet tuna – *Auxis rochei*
- + Kawakawa – *Euthynnus affinis*
- + Stripped bonito – *Sarda orientalis*
- + Long tail tuna – *Thunnus tongol*

### Existing Management strategies

Currently, Vietnam lack of specific legal framework for neritic tunas fisheries management. Some parts of the legal frameworks for fisheries management have been considered as management tools for neritic tunas fisheries, such as Fisheries Law and Decrees, Circulars specified: production, business conditions including fisheries; ensuring safety for fisher and fishing vessels; the management of fishing activities of organizations/individuals in Vietnam waters; administrative sanctions regulations in the fisheries sector.

### Management issues

- Lack of specific legal framework for tuna fisheries management;
- Weak and poor essential resources, minor role/power and involvement of fishery authorities;
- Weak MCS system (implementation of current regulations);
- IUU fishing increased;
- Poor infrastructure for fishery;

### Technical matters

- Overfishing capacity
- Poor handling practices and high proportion of post harvest lost;
- Not all fishers comply and willing to use *Fishing vessels monitoring system (VMS)*;
- Insufficient data for stock assessment: Logbook applied but poor coverage; Port sampling uncontinuous collected; On boat observers not implemented;
- Stock assessments with high variation and uncertainty;
- Database is not well handling and frequently updated;

### Conclusion

- There is lack of legal framework for the neritic tuna fisheries managements;
- Weak MCS system (implementation of current regulations); IUU fishing increased;
- There is lack of information (resources status, landing data, biological information) for stock assessments of the neritic tunas (logbook applied but poor coverage; Port sampling uncontinuous collected; On boat observers not implemented);
- Poor handling practices and high proportion of post harvest lost;
- Overfishing capacity; mostly, fisheries resources are being overfished;

Thank you for  
your attention

**Preliminary result of population study of LOT in Southeast Asia waters by  
Ms. Wahidah Mohd Arshaad**

**Preliminary Result on the Population Study of *Thunnus tonggol* in the Southeast Asian Region**

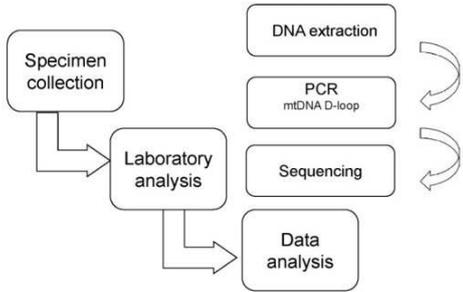

### Introduction

- Longtail tuna (LOT) *Thunnus tonggol* (Bleeker, 1851) is among the economically important species of tuna and is the second smallest among the eight species in the genus *Thunnus*.
- DNA sampling two species, LOT & KAW
- Mitochondrial DNA (mtDNA) displacement loop (D-loop) marker
- Project duration: 2 years (Oct 2016 – Sept 2018)

### Objectives

- To identify the level of genetic diversity of *Thunnus tonggol* (Longtail tuna) in the South China Sea and Andaman Sea.
- To identify the genetic structure of *Thunnus tonggol* (Longtail tuna) in the South China Sea and Andaman Sea waters by using mitochondrial DNA (mtDNA) displacement loop (D-loop) marker.

### Materials and methods

```

    graph TD
      A[Specimen collection] --> B[Laboratory analysis]
      B --> C[DNA extraction]

MYKP	43	43	108	1	0.01721
MYKT	47	47	76	1	0.01449
CBSV	50	50	86	1	0.01460
CBVT	49	49	84	1	0.01388

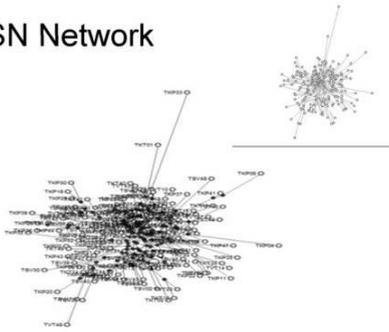

\*Hd = Haplotypes diversity  
\*Nd = Nucleotide diversity

865 bp  
No of haplotypes: 186  
Shared haplotypes: 3  
Hd: 0.9988

## Phylogenetic relationship

### Tree

## MSN Network

## Genetic Distance

	MYKP	MYKT	CBSV	VTVT
MYKP	0.018			
MYKT	0.016	0.015		
CBSV	0.016	0.015	0.015	
VTVT	0.016	0.014	0.015	0.014

## Discussion

Mitochondria DNA D-loop marker analysis of 189 specimens from four locations:

- The overall haplotype diversity (0.998) and nucleotide diversity 0.01516.
- No significant genetic differentiation was found between the four sampling localities. Mean, *Thunnus tonggol* in South China Sea and Andaman Sea is a single stock.

• This preliminary finding in line with:

- 1) LOT shows genetic partitioning across, but not within, basins of the Indo-Pacific based on mtDNA (Willette et.al 2015). (Vung Tau, Palawan, Pemangkat & Pekalongan). D-loop, 885bp, specimen no. is 139. Found: 132 haplotypes.
- 2) Genetic homogeneity in LOT from the northwest coast of India inferred from direct sequencing analysis of the mitochondrial DNA D-loop region (Swaraj et. al 2014). (Verarel and Ratnagiri). Using D-loop, 500bp, specimen no. is 98. Found: 95 haplotypes.

## Conclusion

Based from mitochondria DNA D-loop region analysis of 189 specimens from four locations (Kuantan, Kuala Perlis, Sihanoukville and Vung Tau), found that the *Thunnus tonggol* in South China Sea and Andaman Sea is a single stock.

(1) Brunei		
(2) Cambodia		
(3) Indonesia (2 stocks)		(Malacca)
(4) Malaysia (2 stocks)		(Malacca)
(5) Myanmar		(Bay of Bengal and Andaman)
(6) Philippines		
(7) Thailand (2 stocks)		(Andaman)
(8) Viet Nam		

What type of data we need to collect for stock assessments?

... depends on stock assessment type, i.e.,

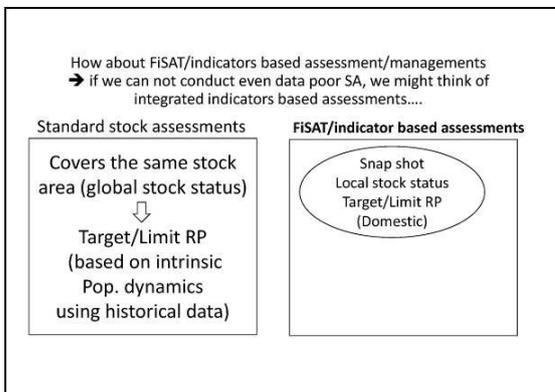

Data required by stock assessment models

	Structure	Model (example)	Data				
			Catch	CPUE	size	biology	space/tag
(1)	Catch (datapoor)	SRA					
(2)	Production model	ASPIC					
(3)	Age/size	VPA					
(4)	Integrated	SCAA/SCAS					
		SS3					

**As the 1<sup>st</sup> step, we attempt simple models (1) or (2) as for LOT and KAW (ASPIC), later we do (3) with biological info.**

Differences between SRA and PM (ASPIC) (theory and Estimation)

Method=>	PM (ASPIC)	SRA (data poor)
basic model	Population growth equation (e.g. logistic curve)	
catch	available	available
CPUE	available	not available
Estimation : r and K	r and K will be estimated statistically	optimum r and K will be searched by simulations
Estimation process	simpler	Complex ==> Highly computing intensive approach
software	available	we absolutely need to be developed

For highly migratory species (seer fish)

We need the global stock assessments (same stock area)  
 → global MSY and Risk assessment

Domestic management (limited time + area)  
 FISAT/indicator based assessments • management (SA based Risk assessment on not possible)

We prefer to ASPIC.. Why ?

SRA (data poor method)

- Results are not ROBUST (based on simulation)
- very computer intensive + complicated (no software)

ASPIC

- Results are more Robust (real data)
- Simple (software available)

But if we don't have CPUE → catch model

If we have CPUE,

ASPIC (as applied for LOT and KAW)

↓

CPUE standardization (simple version for GLM is ready)

**We need further functions for GLM (interaction terms etc.)**

**In addition, we expect a lot of 0 CPUE (seer fish)**

**We need other models (Negative binominal, delta log normal...)**

↓

Need to include additional functions + models (further development)

ASPIC (software are available)

To conduct SRA or ASPIC

We need 2 information

(1) Global catch            both SRA and ASPIC

(2) Nominal CPUE        ASPIC only

\*\*\*\*\*

**(3) (extra) Species compositions**

**1<sup>st</sup> step**

**historical data mining and compilation**

**by member country (NO collection ← no time)**

but you are requested to continue to **collect** CPUE, biological data at sampling sites following SOP

↓

In the future they will be used for age/size structured integrated stock assessments (SCAA)

How to compile and submit seer fish catch and CPUE data

**Indo-Pacific King Mackerel**

**Narrow-barred Spanish Mackerel**

Indonesia, Malaysia and Thailand: 2 data sets (Indian and Pacific)

Pacific and Indian stocks covered by country -

	(a) Pacific stock - FAO 71 area -	(b) Indian stock - FAO 57 area -
(1) Brunei -	..	..
(2) Cambodia -	..	..
(3) Indonesia (2 stocks) -	..	..
(4) Malaysia (2 stocks) -	..	..
(5) Myanmar -	..	..
(6) Philippines -	..	..
(7) Thailand (2 stocks) -	..	..
(8) Viet Nam -	..	..

### (1) Global catch

What is the global catch ?

In any Stock assessment models---  
**Need total removals (catch) (same stock area)**  
 (all countries + all gears + all fishing areas)  
 to estimate F (fishing mortality)  
 → **Not Good** if we use **partial** catch, i.e.,

**Template for data submission by excel (Example)**  
**Thailand/Pacific stock**  
 Annual seer fish catch by gear and species (tons)  
*0 (zero) catch are also important statistics (don't forget)*

year	Gear 1 (PS)			Gear 2 (GILL)			Total		
	Spanish	King	combined	Spanish	King	combined	Spanish	King	combined
2005			345			3,356			3,701
2006			123			1,123			1,246
2007			123			6,789			6,912
2008	234	0		346	987		234	987	
2009	122	456		0	298		578	754	
2014	787	324		223	1,256		1,010	1,580	
2015	0	654		788	1,298		788	1,952	

If you don't have dis-aggregate catch by species report the aggregated catch (it is OK)

**Template for data submission by excel (Example)**  
**Thailand/Pacific stock**  
 Annual seer fish catch by gear and species (tons)  
*0 (zero) catch are also important statistics (don't forget)*

year	Gear 1 (PS)			Gear 2 (GILL)			Total		
	Spanish	King	combined	Spanish	King	combined	Spanish	King	combined
2005			345			3,356			3,701
2006			123			1,123			1,246
2007			123			6,789			6,912
2008	234	0		346	987		234	987	
2009	122	456		0	298		578	754	
2014	787	324		223	1,256		1,010	1,580	
2015	0	654		788	1,298		788	1,952	

But if you can dis aggregate catch using species compositions, please do so.  
 Or send (detail) species compositions by year, season and area

### (2) Nominal CPUE

What is the nominal CPUE?

Raw (original) CPUE data  
 (based on catch and effort)

We need nominal CPUE by country, gear, area, year, month, day and set (boat name) as fine scale as possible (set by set is ideal) important for CPUE standardization

If you don't have set by set data, you can send aggregated levels of CPUE that you have...

For example CPUE **by gear, area and month**

CPUE Example 1 (if species are separated)  
0 and other catch are very important ! Don't forget !!  
 You may have more than 2 types of efforts

**Thailand Pacific stock Gear :GILL Area: 5 (Gulf of Thailand)**

year	month	date	boat name	set	catch (kg)			effort		
					King	Spanish	others	hours	hauls	days
1999	1	1	A	1	34	0	234	12	4	2
1999	1	1	A	2	0	0	566	23	4	4
2015	12	27	C	1	0	0	999	44	5	5
2015	12	27	C	2	0	0	234	23	3	4
2015	12	28	C	1	23	11	333	12	4	5

CPUE Example 2 (aggregated case)  
 (if species are combined and if you have only monthly data → OK)  
 0 and other catch are very important ! Don't forget !!

Thailand Indian stock Gear :GILL Area: 6 (Andaman)						
year	month	catch (kg)		effort		
		king+Spanish combined	others	hours	hauls	days
1999	1	34	234	12	4	2
1999	1	0	566	23	4	4
2015	12	0	999	44	5	5
2015	12	0	2334	23	3	4
2015	12	23	333	12	4	5

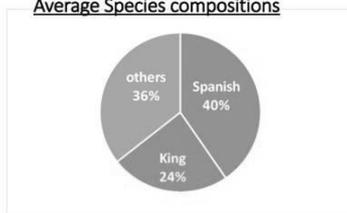

### (3) (Extra data) Species compositions

If species of catch/CPUE are aggregated

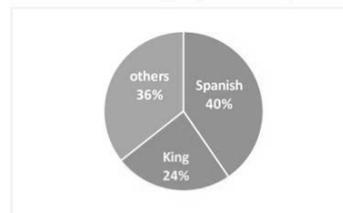

We need information on Species compositions  
 (King + Spanish + Others)  
**by year, season and area (as fine scale as possible)**

If you don't have fine scale information,  
 even **coarse scale** information are also important

For example (fine scale)  
 Thailand, GILL, Area 3 (Andaman Sea) (December, 2016)  
Average Species compositions

For example (highly aggregated still useful)  
 but should be by gear  
 Indonesia 2016 annual average species composition (PS)

- (1) Backgrounds
- (2) Global reviews
- (3) Procedures of Our works
- (4) **Work plan**

### Work plan: Seer fish (Spanish and King mackerel)

Year	2017		2018								
	11	12	1	2	3	4	5	6	7	8	9
Historical seer fish data mining and compilation	member countries, SEAFDEC and Nishida										
Development of advanced GLM software (CPUE standardization)	Nishida and Environment Simulation Laboratory										
Development SRA soft					only if needed						
Risk assessment software (completed)	[Progress bar from 0% to 100%]										
Stock + Risk assessment training (seer fish)						(a)					
5th SWG –neritic tunas											

(a) 10 days (3rd-4th week)

### Summary: software

	CPUE standardization	stock assessments	Kobe plot	Risk assessment
	GLM with more functions + other models (NB, DLN etc)			
SRA (Stock Reduction Analysis)	No need	(1) need to develop (\$\$\$) if we use	(3) available	(1) available
ASPIC	(1) Need to develop (\$\$\$)	(2) available		

Note

(1) SEAFDEC property (need permission from Secretariat to use)

(2) Free software - web link will be available soon

(3) Free software available <http://ocean-info.dfo.jp/kobeaspm/kobeplot/KobePlot.zip>

### Summary: Steps of our works

- (1) Before training
  - Data mining and compilation (catch and CPUE)
- (2) Training (April, 2018)(?)
  - CPUE standardization (software)
  - Stock and Risk assessments (Kobe plot I+II)
- (3) 5<sup>th</sup> SWG (July, 2018)(?)
  - Management advice
- (4) After 5<sup>th</sup> SWG
  - Consider management measures (higher levels)
  - Member countries → SEAFDEC → ASEAN (?)

Before starting,  
we need to **check your PC in advance**  
for smooth trainings  
late this afternoon and tomorrow

### Minimum requirement for participant's PC

- Operation System: MS window 7or newer version that must include **Word, Excel and PowerPoint**.
- No MAC (apple) PC are allowed as our software cannot be used.
- RAM: minimum: 2GB
- Both 32bit/64bit are OK.
- If you don't have "R" in your PC, please pre-install "R" language from the internet, which needs for Kobe plot software
- If you don't have ".NET Framework4" in your PC, please pre-install ".NET Framework4" from the internet, which needs for Kobe plot software.
- **If you have the Kobe plot software in your PC, please un-install in advance. We will provide the new versions at site.**

### 19 Data coordinator for seer fish (draft)

No	Country	stock	Coordinators	Post	Agency	e-mail

**Closing Remarks**

*By Chief of SEAFDEC/MFRDMD  
Mr. Raja Bidin Raja Hassan*

Assalamualaikum WBT and very good afternoon,  
Mr Shamsudin Basir, Co-Chair for SWG on Neritic Tuna  
Dr Tom Nishida, Our resource person from Japan,  
Dr Kenji Taki, Deputy Chief of SEAFDEC/MFRDMD,  
Members of Scientific Working Group on Neritic Tuna  
Senior Officers from Secretariat, TD and MFRDMD  
Observers,  
Ladies and Gentlemen:

Today is the last day for our program, which focus on advance training course on risk assessment of longtail tuna and kawakawa in the Southeast Asian waters.

It is indeed a great pleasure for me to say few words before we end our meeting and training program, which organized by SEAFDEC/MFRDMD in collaboration with SEAFDEC/Sec. This training program was conducted back to back with SWG meeting, because as you was informed, Dr Tom Nishida was not available during August training program, so we try to fix one day training, especially on application of risk assessment program for benefit of member countries.

I am really hope that you are able to catch up all the procedures to to analyses the data and are able to determine TAC or TAE for management of your targeted resources.

In this opportunity, I would like to express our sincere thanks and gratitude to Dr Tom Nishida and all of you, who are able to join our meeting and training.

I hope you all have a safe journey home and hopefully we could meet again in future. Lastly, I would like to take this opportunity to express our sincere thanks to the organizing committee and all peoples behind the screen.

Finally, in the name of Allah, the most Gracious and Merciful, I would like to declare our SWG Meeting and **Training on Longtail Tuna and Kawakawa in Southeast Asia**” officially close.

Thank you, Sayonara.
