DETERMINATION OF TOTAL LIPID CONTENT

LOW LAI KIM AND NG CHER SIANG

INTRODUCTION

This method enables the total lipid of the fresh fish sample to be determined without the destruction of the lipid extract.

APPARATUS

1. Analytical balance (at least 1 mg sensitivity)
2. Rotary vacuum pump (max vacuum = 3 x 10^{-2} mbar)
3. Water bath with temperature control system (40°C)
4. Desiccator
5. Test-tubes
6. Pipette (5 ml)

PROCEDURE

1. Dry test-tube in desiccator for half an hour and weigh accurately.
2. Pipette accurately 5 ml of the extract into the dry preweighed test-tube.
3. Remove solvent completely using the rotary evaporator under reduced pressure at 40°C (water-bath temperature).
4. Attach the test-tube to a rotary vacuum pump and dry the sample for about 5 min.*
5. Leave the test-tube in a desiccator for 30 min and weigh the test-tube and contents accurately.

* Drying can also be done in an electric air oven at 105°C for 30 min. However, the lipid may oxidise and hence increase the weight of the dry sample by about 4 to 10%.

CALCULATIONS

Total lipid content (%) = \(\frac{W_1}{V_e} \times \frac{V_t}{W_s} \times 100\)

where  
\(W_1\) = weight of dried lipid
\(W_s\) = weight of skin or meat used
\(V_e\) = volume of extract used
\(V_t\) = total volume of extract prepared
