Foreword

It is well recognized that fishery statistics play very significant role in the formulation of national fisheries policies. Towards this end, the ASEAN and SEAFDEC Member Countries identified the need to “strengthen national fishery statistical systems and maximize their use for fisheries planning and management and develop standard definitions and classifications to facilitate regional fishery statistics and information exchanges” in the ASEAN-SEAFDEC Resolution and Plan of Action on Sustainable Fisheries for Food Security for the ASEAN Region adopted in 2001. Guided by such specific directive, SEAFDEC continued to compile fishery statistics and information from the data provided by the Member Countries in order to provide the basis for understanding the status and conditions of the fishery resources in the Southeast Asian region.

Moreover, SEAFDEC also enhanced its collaboration with various organizations, notably with the Food and Agriculture Organization (FAO) of the United Nations in order to harmonize the reporting system for fishery statistics by the ASEAN countries to SEAFDEC and to FAO. Harmonization of recording and reporting of fishery statistics was facilitated through the recently published Regional Framework for Fishery Statistics of Southeast Asia published by SEAFDEC which contains among others, the minimum requirements for the collection and compilation of fishery statistics by the Member Countries for subsequent submission to SEAFDEC and FAO. Specifically, the Framework also includes harmonized standard definitions and classifications of relevant statistical information consistent with the regional requirements as well as with those of international standards. Following such development, SEAFDEC shall henceforth call this publication which was originally known as the “Fishery Statistical Bulletin for the South China Sea Area” as the “Fishery Statistical Bulletin of Southeast Asia”.

It is noteworthy that with the Framework as reference, improvements have been made in the collection and compilation of fishery statistics by the Member Countries. The inputs from the Member Countries had therefore led to the improvement of the contents of this Bulletin. However, more efforts are still needed for the collection and compilation of fishery statistics from inland fisheries. The fact that catches from inland waters are not reported by rural communities in the national statistics of many countries, is a concern that henceforth needs much attention. Although, some countries have started to report their respective production from inland fisheries which had been reflected in the current issue of the Bulletin, still some countries have not yet developed their own systems.

SEAFDEC together with the ASEAN countries therefore wished to address the various concerns in the compilation of the complete fishery statistics of the region by developing the proposed inputs for the 2011 Resolution and Plan of Action viz: “strengthen knowledge/science-based management and development of fisheries through mobilization of existing available statistics and information, regional data and information sharing mechanism and capacity building”. Under this proposed framework, SEAFDEC and the ASEAN countries are envisaged to exert more efforts towards the further refinement of the Regional Framework to include extensive and enhanced ways of reporting relevant statistics particularly in the inland capture fisheries and aquaculture sub-sectors.

SEAFDEC is hopeful that this compilation could be further improved in the near future with the continued full support and cooperation of the Member Countries. As can be seen from this current issue of the Bulletin, there are already improvements compared with the previous issues especially in the inland capture fisheries sub-sector. As our commitment, SEAFDEC would continue to publish the Bulletin for the benefit of the countries and consider it as our way of assisting the ASEAN countries in their efforts towards improving fisheries management for food security in the region.

Chumnarn Rongsri, Ph.D.
SEAFDEC Secretary-General and
Chief of SEAFDEC Training Department

I. EXPLANATORY NOTES

EXPLANATORY NOTES

1. GENERAL NOTES

1.1 Data Collection

The data compiled in this Bulletin are in principle based upon the returns received from countries to a questionnaire prepared by the Secretariat, Southeast Asian Fisheries Development Center (SEAFDEC).

1.2 Time Reference

Data in this Bulletin refer, in general, to the year 2005. However, in cases where a country was not able to supply the statistics of that year, the latest data available have been included in the tables.

1.3 Standard Symbols and Abbreviations

The following standard symbols and abbreviations are used throughout the tables:

...	=	Not available
-	=	Magnitude zero or not applicable
0	=	Magnitude insignificant, i.e., less than half of the measurement
MT	=	Metric ton
US\$ 1,000	=	1,000 dollars in U.S. currency
No.	=	Number
Q	=	Quantity
V	=	Value
()	=	A figure (in parenthesis) given in a different unit of measurement as indicated in a footnote.

2. NOTES ON STATISTICS

2.1 General Geographic, Demographic and Economic Statistics

2.1.1 General notes

Most of the data in this section (land area, length of coastline, inland water area, population, manpower, gross domestic product, wage and price, external trade, foreign exchange rate) are collected by each country from the statistics published by its central statistical office. Statistical terms used in this section are the same as those used in the statistics of the United Nations.

2.1.2 Explanatory notes on the terms used

Water body:

See definition given in Paragraph 2.8.2 (p.x).

Population:

The data refers to mid-year population. The figure should be shown in million persons, with two digits after the decimal point.

External trade:

The coverage of the fishery commodities under this item should be the same as for the statistics on export and import of fishery commodities. Please refer to paragraph 2.13.2 (p.xv).

Foreign exchange rate:

Prevailing rate which has been used for statistical purposes for conversion of national currency into US\$.

2. NOTE ON STATISTICS

2.1 Statistical Coverage

Fishery Statistics Bulletin of Southeast Asia covers the fishery statistics on Production; Fishing Units; Fishing boats; Fishers; and Fish Price. Production (landings) covers fishes, crustaceans, mollusks, and other aquatic animals and plants taken for all purposes (capture fisheries and aquaculture animals and plants taken units and aquaculture activities operating in marine, brackishwater and freshwater areas, in appropriate geographical categories.

2.2 Geographical Coverage

The data also cover all production by commercial and small-scale fisheries and aquaculture activities in freshwater, brackishwater and marine water designated by FAO Fishing Area 57 (Indian Ocean, Eastern), 71 (Pacific, Western Central), 61 (Pacific, Northwest), and 04 (Asia, Inland Water). Countries and sub-areas to be used in marine fishery statistics are established in consistent with the FAO Fishing Areas see detail map and description in Appendix 1.

2.3 Fishery Structure and Sub-sectors

In line with the structure of fisheries in the Southeast Asian region, the statistics are divided into two main sectors, such as Capture Fishery and Aquaculture. Capture means an economic activity to catch or collect aquatic organisms which grow naturally in public waters and which do not belong to the property of any person whereas culture means an economic activity to rear the young aquatic organisms such as fry, fingerlings, oyster seeds, etc. to commercial size. Unlike capture, aquatic organisms under culture operations belong to the property of a specific person or a group of specific persons who manage them until they grow to commercial size.

2.3.1 Statistic on Capture Fisheries

With concerns in the different environment of fishery resources and other components of capture fishery, the statistics compiled under this section are classified into two sectors, namely Marine Capture Fishery and Inland Capture Fishery. Statistics on production or catch, fishing gear, fishing boats, fishing units, fishers, etc. will be collected and compiled under each sector.

2.3.1.1 Marine Capture Fisheries

a. Coverage and definition

Marine capture fishery is divided into two sub-sectors: small-scale fishery (including subsistence fishery / artisanal/traditional) and commercial fishery. As it is not possible to establish common definition of these two categories in the region, the national distinction between small-scale and commercial fisheries of countries in the region is given in Appendix 2. The data for marine capture fishery exclude sport fishing, recreation, and research.

b. Marine Capture Production

The statistics for marine production represent the statistics on catches and landings of marine and brackishwater species of aquatic organisms, killed, caught, trapped or collected for all commercial, industrial, and subsistence purposes. The statistics in terms of quantity will be used to assess the stock of the marine organisms, to disclose the size of a fishing industry as a whole, and to be used as index showing the sta-

tus and trend of a fishing industry by annual series of fisheries industry in monetary terms to adequately compare the economic size of the fisheries industry with those of other industries.

b.1 Unit of Measurement

1) Production in quantity

Production in quantity represents the weight equivalent of the landing. Production in quantity should be reported in metric tons, except those expressed in numbers or in kilogram. If production is reported in kilograms, this should be converted into metric tons estimated by rounding off to the nearest hundredths. The production of ornamental fish and reptiles will be reported in numbers.

There are many instances where the catches on board fishing vessel are gutted, filleted, salted, dried etc. or reduced to meals, oil etc. The data on the landing of such species and products require conversion by accurate yield rates (conversion factors) to establish the live weight equivalents (nominal catches) at the time of their capture.

2) Production in value

Production in value represents the products' value equivalent of the landing (average monthly weighted value, where available). It is generally estimated by multiplying the quantity of production by the producers' price. In reporting production in value, the amount reported in the national currencies should be converted to US\$.

b.2 Statistic on Marine Capture Production

1) Production by species

Marine capture production covers production from all kinds of commercial and small-scale fisheries broken down by species (at the species, genus, family or higher taxonomic levels into statistical categories called species items).

The standard statistical list of marine species is developed in consistent with the 'International Standard Statistical Classification of Aquatic Animals and Plants' (ISSCAAP) with two-digit group code. Statistics on marine species items or group items or group should be reported by referring to the FAO English name, Taxonomic code in 10 digits, and inter-agency 3-alpha code, and national/local name. Please refer to Appendix 3 for the ISSCAAP and the regional list of aquatic animal and plants.

2) Production by type of fishing gear

The production classifies under commercial and small-scale fisheries, where possible should be further classified into detailed typed of fishing gear for each category.

To complete the statistics on production by type of fishing gear, the Regional Classification of Fishing Gear developed in consistent with the CWP-International Standard Statistical Classification of Fishing Gear (ISS-CFG) is shown as Appendix 4.

c. Fishing Boat

Fishing boats can be also be called in various terms as fishing vessels, fishing fleets, or fishing crafts. Fishing boat means any vessel, boat, ship of other craft and is equipped and used for fishing or in support of such activity. Statistics on fishing boats will be used to clarify the amount of capital invested in a fishery corresponding to the size of fishing boat. Such statistics can also be used as inputs for the economic analysis and measure of the material input productivity of fishing industry, and as a rough indication of the fishing effort considering the size of the fishing boat.

c.1 Coverage of Fishing Boat

The statistics should cover annual data of fishing boats in marine areas. All boats used in fishing, whether registered with the government or not, should be included.

c.2 Classification of Fishing Boat

Based on the characteristics of marine capture fisheries in the Southeast Asian region, one fishing boat can operate various types of fishing gear as well as catching many target species.

The regional classification of fishing boats is then developed separately from the Coordinating Working Party on Fishery Statistics (CWP) in order to present the specificity of the fisheries situation of the region. In compiling the statistics on fishing boats and fishing units for marine capture fisheries in the region, the Regional Classification of Fishing Boats by Type of Boats has been developed as shown in Appendix 5.

Tonnage is expressed uniformly in gross ton. When a unit other than gross tons is used to measure the size of the boat, this should be converted into gross tons. Although the method of measurement of the tonnage of fishing boats varies from country to country, statistics should be based on national measurement standards.

d. Fishing Unit

Fishing unit means the smallest unit in as fishing operation, which comprises generally a fishing boat, fishers and fishing gears. In cases where two fishing boats are jointly operated in fishing such as the pair trawler or two-boat purse seine, these two fishing boats are regarded as one fishing unit.

A fishing boat may be counted as two or more fishing units on the same year if it uses different kinds of fishing gears in separate seasons. For instance, in cases where a fishing boat operates trawl fishing half a year and gill net fishing during the other half of the year, the fishing boat is regarded as two fishing units. Fishing units are generally counted by type of fishing gear. The statistics on fishing unit is mainly used to consider the limitation of the number of fishing units for fisheries management.

d.1 Coverage of Fishing Units

The statistics should cover the annual data of fishing units operated in marine and coastal areas. Fishing units operating without boats or non-powered boats are excluded.

d.2 Classification of Fishing Units

Fishing units are classified by type and size of fishing boats as well as major types of fishing gear. In cases where a fishing unit operates more than two fishing boats such as the pair trawl and two-boat purse seine, the size is represented by the tonnage of the major single fishing boat from among the boats employed. The type of fishing gear is based on the national classifications. In order to facilitate reporting of the statistics on fishing units, please refer to Appendix 4 for the details.

e. Fishers

e.1 Coverage of Fishers

The statistics on fishers are generally obtained from the Marine Fishery Census of the Member Countries. The statistics should cover all commercial and subsistence fishers operating in marine and brackishwater areas for catching and landing of all aquatic animals similar types of boats.

e.2 Classification of Fishers

Statistics on the number of fishers by sub-sectors of fisheries and working status should be based on the following two main categories: full-time fishers and part-time fishers. For the detailed classification of the fishers, please refer to Appendix 6.

1. Full-time fishers/farmers: fishers/farmers who spend all of their working time in fishing/farming
2. Part-time fishers/farmers: fishers/farmers who spend part of their working time in fishing/farming

2.3.1.2 Inland Capture Fishery

a. Coverage and definition

Inland Capture Fishery refers to any activity involving the catching or collection of aquatic organisms, which grow naturally in inland water bodies for economic, livelihoods and food security purposes. The statistics cover the annual data of commercial and subsistence operations for catching and collecting, and landing production of all aquatic animals in freshwater areas.

The statistics on inland capture fishery cover all productions and the people involves in fishing designated by FAO Fishing Area 04

b. Inland Capture Production

The statistics for inland capture production present the catch of freshwater species of aquatic organisms that are killed, caught, trapped or collected for all commercial and subsistence purposes.

b.1 Unit of Measurement

1) Production in quantity

Production in quantity represents the weight equivalent of aquatic organisms caught and collected in inland water bodies. Production in quantity should be reported in metric tons, except those expressed in numbers. If production is reported in kilograms, this should be converted into metric tons estimated by rounding off to the nearest hundredths.

2) Production in value

Production in value represents an estimation of the value equivalent at the first point of sale, indicating seasonal variations in the average total value where available, with estimations including aquatic products caught and collected for subsistence and household purposes. In reporting production in value, the amount reported in national currencies should be converted to US\$.

b.2 Statistics on Inland Capture Production

1) Production by species

Inland capture production covers all aquatic animals and plants in inland waters broken down by species (at the species, genus, family or higher taxonomic levels into statistical categories called species items). The standard statistical list of freshwater species is developed in consistent with the 'International Standard Statistical Classification of Aquatic Animals and Plants' (ISSCAAP). The statistics of freshwater species items or groups should be reported using in the same format as that for marine species. The regional standard statistical list of aquatic species is given Appendix 3.

2) Production by type of water bodies

Statistics on production from inland capture fishery should be presented in accordance with the following four types of water bodies:

- (a) Lakes: Non-flowing, naturally enclosed bodies of water, including regulated natural lakes but excluding reservoirs
- (b) Rivers: running water body such as rivers, drainage canals, irrigation canals which also cover creeks, streams and other linear water bodies
- (c) Flood plains/rice fields: seasonally flooded areas including paddy fields
- (d) Reservoirs: artificial impoundments of water used for irrigation, flood control, municipal water supplies, recreation, hydroelectric power generation, and so forth
- (e) Others: Any water bodies other than the above; Peri-urban wetland is included in this category

3) Production by type of fisheries

Inland fisheries is quite diverse in its involvement of different groups of people, the scale of operation and the types of gear/boat used as well as in its seasonal variation. As available records would allow, the statistics under the Framework should try reflect such variations.

- (a) Categories of scale
 - Commercial
 - Family/small scale
 - Household occasional fishing
- (b) Categories of application/seasonality/licensing
 - Fishing lots/Leasable fisheries and other types of licensed fisheries and/or areas for (commercial) fishing
 - Dai fisheries (term used to exemplify the national/regional importance of specific type of fisheries)
 - Community fisheries and other rights/based fisheries at village level
 - "On farm" fishing, fishing in rice fields, etc.
- (c) Categories of equipment/gear/boats
 - Set nets/traps
 - Gear operated from boats
 - Mobile gear/hand line/hooks/etc.

c. Fishers**c.1 Coverage of Fishers**

The statistics on fishers for inland capture fishery are generally obtained from the respective National Fishery Census (or Agricultural Census). Statistics on fishers cover fishers engaged in inland capture fishery while persons operate fishing in marine area as well as any type of aquaculture should be excluded.

c.2 Classification of Fishers

Fishers in this section are mostly rural people who, in one way or another, seasonally or the whole year, full-time or part/time, are involved in activities related to the catch and collection of aquatic organisms in inland water bodies. Some of the information/statistics related to household occasional fishing could also be found in other sources of statistics that are available at fisheries agencies.

As far as possible, the relative involvement of people in fishing should be reported to reflect the importance of inland fisheries to the countries whether nationally, locally, seasonally as well as for rural livelihood in general. Fishers/people involved in fishing could be classified into:

- a) Full-time
- b) Part-time (including seasonally full-time)
- c) Occasional fishing by household members (which could be a daily exercise)

2.3.2 Statistics on Aquaculture**a. Coverage and Definition**

Aquaculture means the farming of aquatic organisms including fish, mollusks, crustaceans, echinoderms, and aquatic plants. Farming implies some form of intervention in the rearing process to enhance production, such as regular stocking, feeding and protection from predators. Farming also implies individual or cooperative ownership of or rights resulting from contractual arrangements to, the stock being cultivated primarily for livelihood and business activities. For statistics purposes, aquatic organisms harvested by an individual or corporation, which has owned them throughout their rearing period contribute to aquaculture, whereas aquatic organisms exploited by the public as a common property resources, with or without appropriate licenses, are the harvest of fisheries .

Considering the different ecology and resources in aquaculture, the statistics on aquaculture could be classified into three sub-sectors, namely: mariculture, brackishwater culture, and freshwater culture. The distinction between these categories should be based on culture environment where the aquatic organism is farmed or cultivated. Considering aquaculture production, some aquatics species can be cultured in various environments, its production then could be reported in more than one sub-sector, e.g. Java barb, tilapia, milkfish, etc.

1) Mariculture

The farming or growing-out of aquatic animals/plants takes place in full seawater. This includes the culture of groupers, milkfish and other marine fishes in sea cages offshore or in coral reef coves; abalone and giant clams in coral reefs; seaweeds in longlines along the sea coasts; oysters in longlines.

2) Brackishwater culture

The farming or growing-out of aquatic animals/plants takes place in estuaries, river mouths, mangrove lagoons or in ponds with seawater. This includes culture of groupers and other fishes in cages; milkfish and penaeid shrimps in ponds; mud crab in pens in mangroves; oysters, mussels and other bivalves in estuaries.

3) Freshwater aquaculture

The farming or growing-out of aquatic animals/ plants takes place in lakes, reservoirs, rivers, rice fields, small farm impoundments or in freshwater ponds. This includes culture of carps, tilapias and other freshwater fish species in reservoirs, lake cages, and ponds; catfishes in ponds; freshwater prawns in ponds.

b. Aquaculture Production**b.1 Unit of Measurement****1) Production in quantity**

Production in quantity represents the weight at farm gate. Production in quantity should be reported in metric tons, except those expressed in numbers. If production is reported in kilograms, this should be converted into metric tons estimated by rounding off to the nearest hundredths.

2) Production in value

Production in value represents the producers' price at farm gate. It is generally estimated by multiplying the quantity of production by the farm gate price by species. In reporting production in value, the amount reported in the national currencies should be converted to US\$.

b.2 Statistics on Aquaculture Production

Aquaculture production means the output of farmed aquatic organisms either for final consumption or as raw materials for transformation into other products or for trade. It includes commodities quantified by numbers rather than by weight such as ornamental fishes and hatchery output. The statistics on production could be classified into the following categories:

1) Production by culture environment

The statistics on production should be based on the culture environment where the aquatic organism was cultivated, such as mariculture, brackishwater culture and freshwater aquaculture. One species can be reported in more than one type of environment depending on its tolerant and the culture status in the each country.

2) Production by species

Production from aquaculture could be broken down by species from all types of culture environments in the Southeast Asian region, The list of species is provided in Appendix 3.

3) Production by methods of culture

To facilitate aquaculture management, the production statistics should be reported by methods of culture such as ponds, pens, paddy field or paddy cum fish, etc. The definition of each method is described below.

(a) Ponds and tanks are artificial units of varying sizes constructed above or below ground level capable of holding and interchanging water

(b) Pens refer to water areas confined by net, mesh and other barriers allowing uncontrolled water column between substrate and surface; where pens and enclosures will generally enclose a relatively large volume of water

(c) Cages refer to open or covered enclosed structures constructed with net, mesh, or any porous material allowing natural water interchange. These structures may be floating, suspended, or fixed to the substrate but still permitting water interchange from below

(d) Paddy fields refer to paddy fields used for rice and aquatic organisms; rearing them in rice paddies to any marketable size

(e) Others refer to methods other than the above; rafts. Ropes, stakes are included in this category

c. Artificial Seed Production

The statistics on artificial seed production is presented in order to assess the recruitment in aquaculture and facilitate management purpose. Production could be reported by species in terms of the number of larvae, fingerlings, juveniles, etc. used that focuses on two main objectives, such as for wild stock enhancement and aquaculture practices. As part of wild stock enhancement, production covers both the number released to a controlled environment and to the wild whereas production for aquaculture practices covers seed stocks for mariculture, brackishwater culture and freshwater culture.

d. Aquaculture Unit

Aquaculture unit refers to a management unit, which operates aquaculture in marine, brackishwater and freshwater areas. The term covers both economic units (companies) and households conducting activities in culturing aquatic organism. In Southeast Asian countries, the use of this term varies from country to country, e.g. fishing establishments in Indonesia, farms in Singapore and Thailand.

e. Area under Culture

Area under culture can be referred to as the net area (water surface area) and gross area. Net area refers to the areas of the culture facilities but limited to the water surface area, whereas gross area refers to the culture facilities including not only the water surface area but also the area of the dike surrounding the water area. For ponds and cages, the area under culture will be reported both in net area and gross area while for the other culture methods this could be reported only as net area. The number of culture facilities should also be reported in order to facilitate aquaculture management.

f. Fish Farmers

Fish farmers (or aquaculture workers) under this item, refer to persons who are engaged in aquaculture activities such as people working in farms, hatcheries, and employed in shellfish culture operations, maintenance of aquaculture facilities, water supply, feeding etc. As the number of fish farmers engaged in aquaculture often varies according to the season such as harvesting or construction of the aquaculture facilities, only the fish farmers who are engaged full-time in aquaculture are counted in reporting the statistics on the number of fish farmers.

2.3.3 Statistics on Fish Price

a. Coverage

Statistics on fish price cover aquatic organisms in the form of fresh fish only, which includes marine and freshwater species but excluding processed fish.

b. Definition of Price

Statistics on price refer to products' price, considered as average weighted price which is realized at wholesale markets or in landing centers where producers sell their catches (applicable in some countries in the region). The price is determined (there) by means of auction, negotiation between producers and wholesalers and middlemen, etc., which can also be used to estimate the total production in value.

c. Unit of Price

The products' price should be given in US\$ per kilogram of fresh fish by species. The figure should include two digits after the decimal point by rounding off to the nearest hundredths

Appendix 1**CLASSIFICATION OF FISHING AREAS**

The fishing areas of the Southeast Asian region, established for fishery statistical purposes, consist of inland and marine fishing areas, which is consistent with the definition and classification of capture fishery. There are standardized in accordance with the FAO Major Fishing Areas, the boundaries of which were determined in consultation with international fishery agencies taking into account various considerations, including:

- (i) The boundary of national regions and the natural divisions of oceans and seas;
- (ii) The boundaries of adjacent statistical fisheries bodies already established in inter-governmental conventions and treaties;
- (iii) Existing national practices;
- (iv) National boundaries;
- (v) The longitude and latitude grid system;
- (vi) The distribution of the aquatic fauna; and
- (vii) The distribution of the resources and the environmental conditions within as area.

1. Inland Fishing Areas

All inland waters of Southeast Asian countries are identified under the Area 04 (Asia, Inland Water). There is no sub-area for Asia (Fishing Area 04) that is recognized for the collection of catch and effort data for the Southeast Asian region. The data presented by Lao PDR, which is the sole landlocked country in the region, are therefore reported under Area 04 only.

2. Marine Fishing Areas

The marine fishing areas of the Southeast Asia countries are identified under Area 57 (Indian Ocean, Eastern), Area 71 (Pacific, Western Central) and Area 61 (Pacific, Northwest). Countries and their sub-areas to be used in marine fishery statistics are as follows:

Countries	Sub-areas for marine fishery statistics	FAO Marine Fishing Area	SEAFDEC Sub-areas
a) Brunei Darussalam		71	71i
b) Cambodia		71	71b
c) Indonesia		57,71	
	West Sumatra	57	57e
	South Java	57	57e
	Malacca Strait	57,71	57d, 71k
	East Sumatra	71	71k
	North Java	71	71k
	Bali-Nusa Tenggara	57	57f
	South-west Kalimantan	71	71k
	East Kalimantan	71	71k
	South Sulawesi	71	71k
	North Sulawesi	71	71k
	Maluku-Papua	71	71k
d) Malaysia			
	West Coast of Peninsular Malaysia	57	57c
	East Coast of Peninsular Malaysia	71	71e
	Sabah	71	71f
	Sarawak	71	71g
e) Myanmar		57	57a
f) Philippines		71	71j
	Luzon	71	71j
	Visayas	71	71j
	Mindanao	71	71j
g) Singapore		71	71h
h) Thailand		57,71	
	Gulf of Thailand	71	71a
	Indian Ocean	57	57b
i) Vietnam		61,71	
	North Vietnam	61	61a
	Central Vietnam	61	61b
	Southwest Vietnam	71	71c
	Southeast Vietnam	71	71d

Area 57 (Indian Ocean, Eastern)

Under fishing area 57, marine fishery statistics such as production, species, fishing gear, fishing vessel, fishing units, etc. will be collected and reported within the Exclusive Economic Zone (EEZ) of each country.

To facilitate the reporting fishery statistics by each country, the fishing area in the Southeast Asian region can be divided into 6 sub-areas under, which correspond to the existing EEZs of Myanmar, Thailand, Malaysia and Indonesia. The sub-areas under area 57 are as follow:

- Sub-area 57a: Marine fishing area of Myanmar
- Sub-area 57b: Marine fishing area of Thailand (Indian Ocean)
- Sub-area 57c: Marine fishing area of Malaysia (West Coast of Peninsular Malaysia)
- Sub-area 57d: Marine fishing area of Indonesia (Malacca Strait)
- Sub-area 57e: Marine fishing area of Indonesia (West Sumatra and South Java)
- Sub-area 57f: Marine fishing area of Indonesia (Bali-Nusa Tenggara)

Boundary between Area 57 and 71

1. At the Strait of Malacca, the areas bounded by a line commencing from East Sumatra and across the strait at 2° 30' N latitude to meet the West Coast of Peninsular Malaysia.
2. At marine waters between Sumatra and Java, the areas bounded by a line commencing on the coast of Sumatra at the boundary between the District of Lampung Utara and the District of Lampung Selatan at 5° 31' S latitude, 104° 33' E longitude. The boundary is running along a rhomb line between Cape Tjuku Redak on the mainland of Sumatra and Cape Batu Kebucung on the Island of Tebuan to the position 6° 15' S latitude, 105° 04' E longitude; then along a rhomb line between Cape Parat on the Island of Panaitan and the southeastern tip of the Island of Rakarta to the western coast of Java at the boundary between the District of Lebak and the District of Serang at 6° 23' S latitude, 105° 49' E longitude.
3. At marine waters of Java and Bali-Nusa Tenggara, the areas bounded by a line commencing from 8°00' S latitude starting the coast of South Java at Surabaya and running east to meet at 129°00' E longitude; thence running due south until meet Northern coast of Australia. The area under the line is recognized as the fishing area 57 whereas the other above the line accepted as fishing area 71.

Area 71 (Pacific, Western Central)

Under fishing area 71, marine fishery statistics such as production, species, fishing gear, fishing vessel, fishing units, etc. will be collected and reported within the Exclusive Economic Zone (EEZ) of each country. There are 8 Southeast Asian countries identified under fishing area 71 covering Brunei Darussalam, Cambodia, Indonesia, Malaysia, Philippines, Singapore, Thailand and Vietnam. To facilitate reporting fishery statistics by each country, the fishing area can be divided into 11 sub-areas for the region, corresponding to the existing EEZ of these countries. The sub-areas under area 71 are as follows.

- Sub-area 71a: Marine fishing area of Thailand (Gulf of Thailand)
- Sub-area 71b: Marine fishing area of Cambodia
- Sub-area 71c: Marine fishing area of Vietnam (Southwest Vietnam)
- Sub-area 71d: Marine fishing area of Vietnam (Southeast Vietnam)
- Sub-area 71e: Marine fishing area of Malaysia (East Coast of Peninsular Malaysia)
- Sub-area 71f: Marine fishing area of Malaysia (Sabah)
- Sub-area 71g: Marine fishing area of Malaysia (Sarawak)
- Sub-area 71h: Marine fishing area of Singapore
- Sub-area 71i: Marine fishing area of Brunei Darussalam
- Sub-area 71j: Marine fishing area of Philippines (Luzon, Visayas, Mindanao)
- Sub-area 71k: Marine fishing area of Indonesia (East Sumatra, North Java, Bali-Nusa Tenggara, South-West Kalimantan, East Kalimantan, South Sulawesi, Maluku-Papua)

Area 61 (Pacific, Northwest)

Under fishing area 61, the marine fishery statistics such as production, species, fishing gear, fishing vessel, fishing units, etc. will be collected and reported within the Exclusive Economic Zone (EEZ) of each country. There is only one country identified under fishing area 61, which is Vietnam. The fishing area can be divided into 2 sub-areas as follows:

Sub-area 61a: Marine fishing area of Vietnam (North Vietnam)

Sub-area 61b: Marine fishing area of Vietnam (Central Vietnam)

Appendix 2

CLASSIFICATION OF SMALL-SCALE AND COMMERCIAL FISHERIES

Due to different legal definitions used by each country, the following table shows the classification of small-scale and commercial fisheries of countries in the region.

Countries	Small-scale Fisheries	Commercial Fisheries
Brunei Darussalam	Small-scale/artisanal fisheries: Operating in all zones but concentrating in Zone 1 (0-3 nm)	Trawler, seiner, long liner a) <60 GT; <350 Hp operating in Zone2 b)60.1-150 GT; 351-600 Hp operating in Zone3 c)151-200 GT; 600-800 Hp operating in Zone4
Cambodia	Coastal fisheries small-scale fisheries with/without engine (from 5-50 Hp) operating in Zone1	Commercial fisheries: more than 50 Hp operating in Zone2
Indonesia	Fisheries that its operation without using boat, using non-power boat, using outboard motor size <5 GT, or inboard motor size <5 GT	a)Fisheries that its operation using outboard motor size 5 GT-30 GT or inboard motor size 5 GT-30 GT b)Fisheries that its operating using outboard motor size \geq 30 GT
Lao PDR	-	-
Malaysia	Traditional fisheries: small-scale fisheries using traditional fishing gears (i.e. other than trawls and purse seines) with vessel less than 40 GRT operating in all zones concentrating in Zone A	Commercial fisheries: Medium and large-scale fisheries using commercial fishing gears such as trawls and purse seines a)With vessels less than 40 GRT operating in Zone B b)With vessels from 40-70 GRT operating in Zone C c)With vessels above 70 GRT operating in Zone C2
Myanmar	Coastal fisheries: vessels of less than 30 ft or using less than 12 Hp engine operating in Zone1	Industrial fisheries: vessels more than 30 ft or using more than 12 Hp engines operating in Zone2
Philippines	Municipal fisheries: small-scale fisheries with vessels of less than 3 GT operating in Zone 1 and 2	Commercial fisheries: a)Small-scale commercial fisheries: from 3.1-20 GT vessels operating in Zone 2; can also operate within 10.1-15 km (within Zone 1) if authority is granted by the concerned local government unit (LGU)
Singapore	Small-scale fisheries with vessels of less than 3 GT operating in Zone1	Small-scale commercial fisheries: Inboard engine less than 50 GT or 380 Hp operating in Zone2
Thailand	Small-scale fisheries: vessels of less than 5 GT operating in Zone 1	Large-scale fisheries: vessels of more than 5 GT operating in Zone 2
Vietnam	Small-scale fisheries: vessels with no engine and with engine but less than 40 Hp	Large-scale fisheries: vessels with engine more than 40 Hp

Fishing Zones of Countries in Southeast Asia

Countries	Fishing Zone1	Fishing Zone2	Fishing Zone 3	Fishing Zone 4
Brunei Darussalam	From shore line to 3 nm	From 3 nm to 20 nm	From 20 nm to 45 nm	From 45 nm to EEZ limit
Cambodia	From shore line to 20 m depth	From 20 m depth to EEZ limit		
Indonesia	From shore line out to 4 nm	From the outer limit of first fishing zone to 12 nm from shore	From the outer limit of second fishing zone to EEZ limit	
Malaysia	From shore line to 5 nm	From 5 nm to 12 nm	From 12 nm to 30 nm	From 30 nm to EEZ limit
Myanmar	From shore line to 5 nm in the northern area, 10 nm in the southern area	From outer limit of first fishing zone to EEZ limit		
Philippines	From shore line to 15 km	From 15 km to EEZ limit		
Singapore	From shore line to within Port Limits	From 12 nm to EEZ limit		
Thailand	From shore line to 12 nm	From 12 nm to EEZ limit		
Vietnam	From shore line to 30 m depth in Northern and Southern areas, to 50 m depth in Central area	From 30 to 50 m depth to the EEZ limit		

Appendix 3

LIST OF AQUATIC ANIMALS AND PLANTS

For the statistics on production for capture fishery and aquaculture in the Southeast Asian region, broken down into species, the International Standard Classification of Aquatic Animals and Plants (ISSCAAP) developed by CWP will be used as basis to develop the Regional Standard Statistic List of Aquatic Species, which focused on the species available and their distribution in the region.

For Capture production, since some aquatic animals particularly diadromous species may be caught in both marine and inland waters, the statistics will be reported in two parts of capture fisheries. Regarding aquaculture production since some aquatic species can be culture in more than one culture environment, production can then be reported based on where the species are cultured.

The International Standard Classification of Aquatic Animals and Plants (ISSCAAP) applied for the region is as follows:

Code	Group of Species
1	Freshwater fishes
11	Carp, barbell and other cyprinids
12	Tilapia and other cichlids
13	Miscellaneous freshwater fishes
2	Diadromous fishes
24	Shad
25	Miscellaneous diadromous fishes
3	Marine fishes
31	Flounder, halibut, sole
33	Miscellaneous coastal fishes
34	Miscellaneous demersal fishes
35	Herring, sardine, anchovy
36	Tuna, bonito, billfish
37	Miscellaneous pelagic fishes
38	Shark, ray, chimaera
39	Marine fishes not identified
4	Crustaceans
41	Freshwater crustaceans
42	Crab, sea-spider
43	Lobster, spiny-rock lobster
45	Shrimp, prawn
47	Miscellaneous marine crustaceans
5	Molluscs
51	Freshwater molluscs
52	Abalone, winkle, conch
53	Oyster
54	Mussel

55	Scallops, pectens
56	Squids, cuttlefishes, octopuses
57	Miscellaneous marine molluscs
7	Miscellaneous aquatic animals
71	Frogs and other amphibians
72	Turtles
73	Crocodiles and alligators
76	Sea-urchins and other echinoderms
77	Miscellaneous aquatic invertebrates
8	Miscellaneous aquatic animal products
81	Pearls, mother-of pearl, shells
82	Corals
83	Sponges
9	Aquatic plants
91	Brown seaweeds
92	Red seaweeds
93	Green seaweeds
94	Miscellaneous aquatic plants

Appendix 4

CLASSIFICATION OF FISHING GEARS

For the statistics on fishing units and marine production, breakdown into types of fishing gear, the

Major Group	Minor Group	Standard Abbreviation	ISSCFG Code
1.Purse seine		PS	01.1.0
2.Seine Net		SX	02.9.0
	Boat seines	SV	02.2.0
	Beach seine	SB	02.1.0
3.Trawl		TX	03.9.0
	Beam trawl	TBB	03.1.1
	Otter board trawl	OT	03.4.9
	Pair trawl	PT	03.5.9
4.Lift net		LN	05.9.0
5.Gill net		GN	07.9.1
6.Trap		FIX	08.9.0
	Stationary trap	-	-
	Portable trap	-	-
7.Hook and lines		LX	09.9.0
8.Push/Scoop net		-	-
9.Shellfish and seaweed collecting gear		-	-
10.Others		MIS	20.0.0

Types of Fishing Gears and Definitions

1. Purse seine

A net roughly rectangular in shape without a distinct bag is set vertically in water, to surround the school of fish with purse line, generally of pelagic nature.

Actually, this group of fishing gear called 'Surrounding Net', which is sub-divided into three major groups, such as a) one boat purse seine; b) two-boat purse seine; and c) surrounding net without a purse line. However, in term of fishery statistics, no countries in the region collect the data in such individual groups. Thus, purse seine is the only gear of surrounding net which collect data without detail in one or two-boat operations.

2. Seine net

A bag shaped net with two wings, normally; the wings are larger than those of trawls nets. The net is pulled towards a stationary boat or onto a beach. A seine net of primitive nature sometimes does not have a bag. Insofar as the net is pulled towards a stationary boat or beach, it is included herein. The seine net is sub-divided into two minor groups: a) boat seine and b) beach seine.

2.1 Boat seine

Boat seine consists of two wings, a body and a bag, which is similar to that of trawls. Operated from a boat, they are generally used on the bottom, where they are hauled by two ropes, usually very long, set in the water so as to ensure that as many fish as possible are driven or herded towards the opening of the net. Danish seine is also included herein.

2.2 Beach seine

Beach seine is a simple fishing gear; one end of the wing is held by a group of fishermen on the shore, the net is first set at right angles to the seashore and the direction of the net setting turns gradually towards the shore. After setting all the net, the towing line of the wing is laid out and the boat runs toward the shore providing a certain distance between the landing and setting points. Then, from the two ends of the wings, the buoy line and the sinker line are hauled to catch the fish.

3. Trawl

A conical bag shaped-net with two or more wings, pulled by one to two boats for a period of time, to catch mainly fish or other aquatic animals that live directly on or stay near the sea bed. When such a gear is used in mid-water with the same catching mechanism, the mid-water trawl is included under this group. The trawl is also sub-divided into three minor groups: a) beam trawl; b) otter board trawl; and c) pair trawl

3.1 Beam trawl

The main feature of this trawl is abeam, mostly made of iron. Its purpose is to spread the netting. Sometimes a heavy beam is supported by steel shoes at each end which run over the sea bed. A ground rope and a head rope are joined together to the cement ski that works as a bobbin. The principle catch of beam trawl are shrimps, therefore the mesh size is relatively small. The mesh size of beam trawl also depends on the catch.

3.2 Otter board trawl

Otter boards are used for horizontal spreading of the net mouth. Most otter trawl nets consist of two panels; this is called a 'two-seam net'. The mouth is oval-shaped when viewed from front. Two wings stretch out to increase the swept area and to guide the fish in the net's path down to the cod-end

3.3 Pair trawl

Pair trawl means this net is towed by two boats. In pair trawling, the net mouth is kept open by outward towing of the two boats, which always try keep the same distance between them during operation. The otter boards are not necessary, the arrangement of gear has been simplified, the wrap is connected directly to the sweep lines the other is joined to a triangular iron frame at the end of Gridles from each wing of the net.

4. Lift net

A sheet of net, usually square, but may sometimes be conical, is stretched by several rods, ropes, or a frame and is set either at the bottom or in mid-water for some time and then lifted to trap the fish swimming above it. Both stationary lift nets and portable lift nets are included herein.

5. Gill net

A net wall, with its lower end weighted by sinkers (or heavy net, as in drift gill net) and the upper end raise

by floats, is set across the path of migrating fish. Fish trying to make their way through the net wall are gilled or entangled in the mesh. The trammel net with two to three wall nets is also included herein. The migrating fish are entangled between two layers of nets and not in the mesh where a combination of different types of nets are used.

6. Trap

Trap referred to a gear that is set or stationed in the water for a certain period, regardless of the kind of materials used or their construction, The fish when are naturally confined in a collecting unit from which escape is prevented by labyrinths and/or retarding devices such as gorges, funnels, etc. without any active fishing operation taking place. Trap is also sub-divided into two minor groups: a) stationary trap; and b) portable trap.

6.1 Stationary trap

Considering its operation, this group of trap is stationed in the water for long period at least until the end of fishing season. Most of stationary gear is operated in relation to water current. Stationary trap covers bamboo stake trap, bamboo fence trap, set net, bag net. Etc.

6.2 Portable trap

Trap is portable, designed in form of cages or basket. It can be made of various materials such as wood, bamboo, metal rods, wire netting, etc. It is used with or without bait depending on the target species. Fish trap, crab trap, shrimp trap are included herein.

7. Hook and lines

This gear generally consists of line(s) and hook(s) where natural or artificial baits are hooked to attract fish or other aquatic animals. Unbaited hook or a jig may also be used.

8. Push/Scoop net

A bag net with a fixed or variable opening is operated in shallow waters or from boats. Some large scale scoop nets are operated from a motorized boat such as the boat push net.

9. Shellfish and seaweed collecting gear

All manual gears and complex devices which are used for collecting shellfish and seaweeds, regardless of the type of materials used for their construction. While the manual gear are operated by an individual, some of the more complex devices such as cockle dredge, clam dredge, etc. need a motor boat for their operation.

10. Others

This group of fishing gear covers the great variety of other fishing gears and methods which are not specified elsewhere, including cast net drive-in-net, muro ami, harpoon, etc.

Appendix 5**CLASSIFICATION OF FISHING BOATS**

To compile the statistics on the fishing units considering the existing fishing operations in the region, the Regional Classification of Fishing Boats by Type of Boats is referred to provide figures of the fishing vessel as follows:

Boat Type		Size of Boat
First level	Second level	
1.Non-powered boat		
2.Powered boat		
	2.1Out-board powered boat	
	2.2In-board powered boat	Less than 5 tons
		5-9.9 tons
		10-19.9 tons
		20-49.9 tons
		50-99.9 tons
		100-199.9 tons
		200-499.9 tons
		More than 500 tons

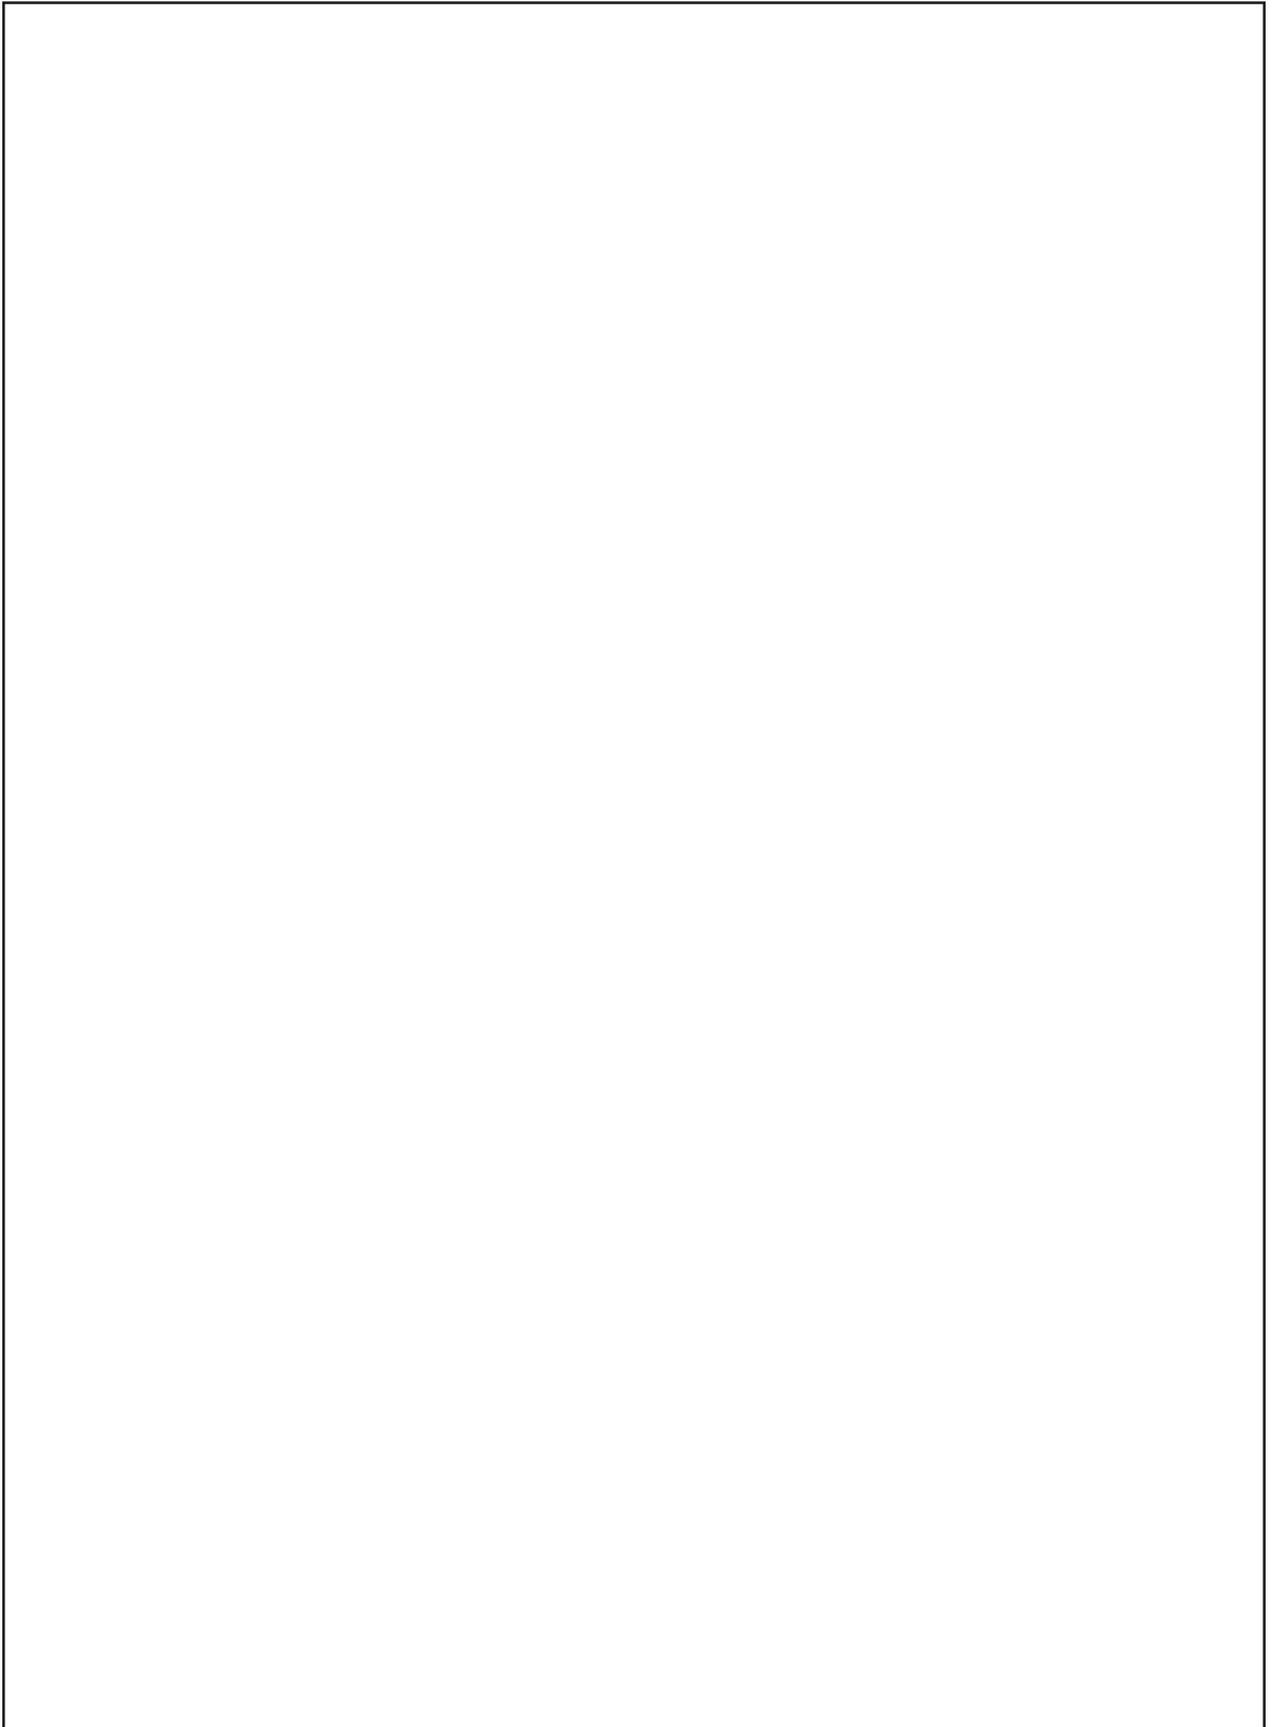

Appendix 6

CLASSIFICATION OF FISHERS AND FARMERS

To compile statistics on the number of fishers by sub-sectors of fisheries and working status, the Classification of fishers and farmers will be used as follows.

Main Category	Working Area	Working Status
1. Fishers (engaged in fisheries)	1.1 Marine capture fisheries	Full-time fishers
		Part-time fishers
	1.2 Inland capture fisheries	Full-time fishers
		Part-time fishers
		Occasional fishing by household members
2. Farmers (engaged in aquaculture)	2.1 Mariculture	
	2.2 Brackishwater culture	
	2.3 Freshwater culture	

SUMMARY 2008

STATISTICAL SUMMARY

AN OVERVIEW OF THE FISHERY SECTOR OF SOUTHEAST ASIA IN 2008

1. The Fisheries Sector

In 2008, the total fishery production of the region was 27,260,013 MT valued at 28,584 million US\$, of which production from marine capture fisheries accounted for 51% (13,814,368 MT), about 9% (2,381,711) from inland capture fisheries, and about 40% (11,063,934 MT) from aquaculture. In terms of value, marine capture fisheries contributed about 43% (12,336 million US\$), inland capture fisheries about 8% (2,215 million US\$) and aquaculture about 49% (14,032 million US\$).

The region's total fishery production and value had slightly increased in 2008 by 8.13% and 19.41%, respectively compared with those of 2007. Overall, production from fisheries remained relatively stable in the last five years from 2004 to 2008. However, the production from marine capture fisheries of 13,814,368 MT in 2008 was a slight decrease over the sub-sector's production in 2007. After increasing from about 13,380,841 MT in 2004 to 13,938,748 MT in 2006, marine capture fisheries production also increased to about 14,056,985 MT in 2007 but decreased to 13,814,368 MT in 2008. But the value of marine capture fisheries in 2008 increased by approximately 3,500 million US\$ compared with that of 2007. Production from inland capture fisheries in 2008 which was 2,381,711 MT valued at 2,215 million US\$, was higher than in 2007 which was 1,979,891 MT and valued at 769 million US\$. Likewise, aquaculture production also increased in terms of quantity and value by 1,889,598 MT and 1,285 million US\$, respectively, over that of 2007.

By country, the highest total fishery production came from Indonesia at 9,054,873 MT. Philippines came second with production of 4,964,703 MT while Vietnam placed third with 4,559,720 MT followed in descending order by Thailand at 3,204,200 MT; Myanmar at 3,147,605 MT; Malaysia at 1,639,017 MT; Cambodia at 536,320 MT; and Lao PDR at 145,687 MT. The lowest fishery production was reported by Singapore at 5,141 MT and Brunei Darussalam at 2,747 MT. For the whole region, the fishery production increased by 6,206,348 MT compared with that of 2004 or annual average increase of 1,241,270 MT during the five-year period from 2004 to 2008.

In terms of value, Indonesia's production was reported to be worth 9,700 million US\$ the highest total fishery value in 2008 followed by the Philippines at 4,675 million US\$. In descending order, Vietnam reported next at 4,618 million US\$; Thailand 3,596 million US\$; Myanmar 3,156 million US\$; Malaysia 2,164 million US\$; Lao PDR 331 million US\$, and Cambodia 317 million US\$. The lowest fishery value was reported by Singapore at 18 million US\$ and Brunei Darussalam at 7 million US\$.

2. Marine Fisheries Production (in quantity and value)

In 2008, the total production from marine capture fisheries was 13,814,368 MT, a slight decrease of 242,617 MT compared with that of 2007. During the past five years from 2004 to 2008, the

reported landing from marine capture fisheries fluctuated between 13.38-13.81 million MT, representing an increase of 3.24% with respect to the 2004 data. Correspondingly, the total value of the catch which was about US\$ 12.33 billion representing a 60% increase over the value in 2004 and an annual average increase of 12% during the five-year period.

The trend of production from marine capture fisheries had not changed since 2004 until 2008, with Indonesia still continuing to take the lead with its production valued at 4.957 million US\$. Philippines came second with production valued at 2.810 million US\$. Although in terms of quantity, Vietnam placed third in the 2008 ranking but the value of its production was not reported. Myanmar reported next with a production of 1,679,010 MT but in terms of value (1,586 million US\$) the country came after Malaysia (1,691 million US\$) with total production of 1,394,531 MT. Thailand followed with a production of 1,644,800 MT valued at 1,276 million US\$ while Malaysia came next with production of 1,394,531 MT valued at 1,690 million US\$ which ranked higher than Myanmar and Thailand. Cambodia reported its production of 66,000 MT (but the value was not reported), Brunei Darussalam at 2,357 MT (valued at 6.9 million US\$) and Singapore at 1,623 MT (valued at 8.6 million US\$).

From 2004 to 2008, production from marine capture fisheries increased in terms of quantity by 433,527 MT or an annual average increase of 86,705 MT and landed value by 4,931 million US\$ or an annual average increase of 986 million US\$. The increasing trend of the production quantity over the five-year period was contributed mainly by Myanmar's production which increased by 476,980 MT, followed by Indonesia's production which had increased by 381,692 MT, production of the Philippines which increased by 310,386 MT, and Vietnam's production which increased by 201,187 MT. In terms of increase in the production value over the five-year period, Myanmar only reported the corresponding value in 2008 but no report was made during the previous years. Indonesia reported an increase of value by 1,793 million US\$ and the Philippines by 1,214 million US\$. Vietnam reported steady increase in production over the five-year period but has never reported the value of its production. Malaysia also reported a production increase by 62,886 MT and increase in value by 588 million US\$. In contrast, Thailand reported a decline in production by 991,169 MT as well as in value by 258 million US\$. Although Cambodia's production increased by 10,183 MT or 18.2% but the value was not reported. Singapore reported decreased production by 550 MT but the corresponding value increased by 2.3 million US\$. Likewise for Brunei Darussalam's production which decreased by 68 MT but the values reported for 2007 and 2008 showed decreasing trend, no information were reported during the previous years.

By species, production in 2008 in terms of quantity and percentage from marine capture fisheries indicated that scad nei (*Decapterus* spp.) had the highest production which far exceeded that for all other species, accounting for nearly 4.1% (564,722 MT) of the total production from marine capture fisheries in the region. The second most heavily exploited species was the skipjack tuna (*Katsuwonus pelamis*) producing 471,902 MT contributing 3.4% to the total production followed by sardinellas nei (*Sardinella* spp.) at 448,342 MT at 3.2%, cephalopods nei at 230,630 MT at 1.7%, yellowfin tuna (*Thunnus albacores*) at 229,986 MT at 1.7%, and frigate tuna (*Auxis thazard*) at 229,986 MT at 1.7% of the total production from marine capture fisheries in the region. The catch of the miscellaneous marine fishes (*Osteichthyes*) was 9,049,323 MT contrib-

uting a total of 34.5% to the region's total production from marine capture fisheries. Despite the fact that a regional breakdown by species in terms of value was not reported by Cambodia, Lao PDR and Vietnam, the data still indicated that skipjack tuna (*Katsuwonus pelamis*) constituted the highest proportion (valued at 21.8 million US\$ contributing 4.3% to the region's total production value from marine capture fisheries) followed by scad nei (*Decapterus* spp.) at 16.6 million US\$ at 3.3%, narrow-barred Spanish mackerel (*Scomberomorus commerson*) at 16.5 million US\$ at 3.3%, banana prawn (*Penaeus merguensis*) at 15.8 million US\$ at 3.2%, *Natantia* at 14.1 million US\$ at 2.8%, and short mackerel (*Rastrelliger brachysoma*) at 14.0 million US\$ contributing about 2.8% to the region's total production value from marine capture fisheries.

In 2008, the top species group that contributed to the marine fisheries catch of Indonesia (4,701,933 MT or 34% of the region's total catch from marine capture fisheries) was led by marine fish nei (*Osteichthyes*) with production of 370,796 MT (accounting for 7.9% of the country's total marine catch) followed by scad nei (*Decapterus* spp.) at 266,787 MT or 5.7%, skipjack tuna (*Katsuwonus pelamis*) at 243,638 MT or 5.2%, short mackerel (*Rastrelliger brachysoma*) at 141,644 MT or 3%, Bali sardinella (*Sardinella lemuru*) at 119,457 MT or 2.5%, kawakawa (*Euthynnus affinis*) at 114,627 MT or 2.4%, goldstripe sardinella (*Sardinella gibbosa*) at 109,770 MT or 2.3%, narrow-barred Spanish mackerel (*Scomberomorus commerson*) at 101,343 MT or 2.2%, and yellowstripe scad (*Selaroides leptolepis*) at 98,565 MT contributing 2.1% to the country's total production from marine capture fisheries.

For the Philippines which had the second highest production from marine capture fisheries in the region, the top ten species that contributed to the country's marine catch of 2,377,514 MT (accounting for 17% of the region's total production from marine capture fisheries) included sardinellas nei (*Sardinella* spp.) at 369,199 MT (contributing 15.5% to the country's production from marine capture fisheries) followed by scad nei (*Decapterus* spp.) at 297,892 MT or 12.5%, skipjack tuna (*Katsuwonus pelamis*) at 222,010 MT or 9.3%, yellowfin tuna (*Thunnus albacores*) at 168,411 MT or 7.1%, frigate tuna (*Auxis thazard*) at 156,341 MT or 6.6%, marine fishes nei (*Osteichthyes*) at 150,467 MT or 6.3%, bigeye scad (*Selar crumenophthalmus*) at 97,149 MT or 4.1%, Indian mackerel (*Rastrelliger kanagurta*) at 91,272 MT or 3.8%, *Stolephorus* anchovies (*Stolephorus* spp.) at 73,235 MT or 3.1%, and *Carrangids* nei (*Carrangidae*) at 72,916 MT contributing 3.1% of the country's total marine catch.

As for Vietnam which accounted for the third highest marine catch in the region, the top species comprised the marine fishes nei (*Osteichthyes*) at 1,454,800 MT (accounting for 74.7% of the country's total production from marine capture fisheries), Cephalopoda at 227,700 MT or 11.7%, *Natantia* at 102,300 MT or 5.2%, Mollusca at 69,000 MT or 3.5%, *Scombroidei* at 21,000 MT at 1.1%, and tropical spiny lobsters nei (*Panulirus* spp.) at 1,500 MT contributing 0.1% to the country's total marine catch.

3. Inland Fisheries Production (in quantity and value)

The total catch from the region's inland waters remained stable at 2,381,711 MT in 2008 from 1,429,167 MT in 2007 for a five-year increase of 952,544 MT. It should be noted, however, that reporting of the inland fisheries production continues to present problems owing to the lack of

reliable information in terms of quantity and species composition. Moreover, catches by rural communities in many countries that comprise the main users of the resources, are not reported in the national statistics. Accordingly, the figures on the total catch provided in this document should be considered as indicative only.

With eight countries reporting the quantity of catch from inland fisheries but only seven countries reported the corresponding values, the regional trend of the inland fisheries sector could not be pictured as of the moment. However, for some individual countries that reported the data in quantity and value, the national picture of their respective inland fisheries could be visualized. Nevertheless, production from inland capture fisheries in the region (2,381,711 MT) accounted for about 8.7% of the region's total fisheries production in 2008. Myanmar as the top producer reported stable inland catch since 2004, and the country's catch from inland fisheries in 2008 was 814,740 MT (34.2% of the region's total inland fisheries production). However, the country's production report was not classified by species, similarly for Indonesia's production of 497,740 MT (20.9% of the region's total inland fisheries production). Cambodia's production from inland fisheries was 430,600 MT accounted for 18.1% of the region's total inland fisheries production, while Thailand's production was 228,600 MT or 9.6% and the Philippines at 179,491 MT or 7.5%. Vietnam's production was 144,800 MT or 6.1% with Lao PDR reporting with 81,387 MT production or 3.4% and Malaysia at 4,353 MT contributing 0.2% to the region's total inland fisheries production.

In terms of value of the catch in 2008, Myanmar also reported the highest value at 788 million US\$ followed by Indonesia at 521 million US\$, Cambodia at 255 million US\$, Thailand at 254 million US\$, Lao PDR at 240 million US\$, Philippines at 145 million US\$, and Malaysia at 10 million US\$. Brunei Darussalam, Singapore and Vietnam did not report the corresponding values of their production from inland fisheries. Therefore, the percentage contribution from inland fisheries to the region's total fisheries production in terms of value could not be established because of lack of data making any conclusion unreliable.

In terms of species, the inland fisheries production of Indonesia at 497,740 MT comprised the freshwater fishes nei (*Osteichthyes*) at 267,192 MT or 53.7% of the country's inland fisheries production followed by striped snakehead (*Chana striata*) at 29,842 MT or 6%, snakeskin gourami (*Trichogaster pectoralis*) at 17,588 MT or 3.5%, Nile tilapia (*Oreochromis niloticus*) at 15,492 MT or 3.1%, torpedo-shaped catfish nei (*Clarias* spp.) at 14,323 MT or 2.9%, glass catfish (*Kryptopterus* spp.) at 13,167 MT or 2.6%, kissing gourami (*Helostoma temminckii*) at 12,703 MT or 2.6%, Asian redbtail catfish (*Mystus nemurus*) and three spot gourami (*Trichogaster trichopterus*) at 12,350 MT or 2.5%, climbing perch (*Anabus testudineus*) at 11,372 MT or 2.3%, and catfishes (*Pangasius djambal*) at 9,724 MT contributing 2% to Indonesia's of the total production from inland capture fisheries.

4. Aquaculture

Under aquaculture, the data included production from mariculture, brackishwater culture and freshwater culture. From the total fisheries production from aquaculture of 11,063,934 MT in 2008 (accounting for about 40% of the region's total fisheries production), mariculture contrib-

uted 4,646,146 MT while 2,072,026 MT came from brackishwater culture and 4,345,762 MT from freshwater culture. Indonesia was the leader in terms of production quantity at 3,855,200 MT or 34.8% of the region's total production from aquaculture, valued at 4,222 million US\$ or 30.1% of the total value of the region's aquaculture production. Vietnam ranked second at 2,468,320 MT accounting for 22.3% of the region's total, valued at 4,618 million US\$ or 32.9% of the region's total. The Philippines reported production of 2,407,698 MT or 21.8% of the region's total and valued at 1,719 million US\$ or 12.2% of the region's total, Thailand at 1,330,800 MT or 12% of the region's total and valued at 2,065 million US\$ or 14.7% of the region's total, Myanmar at 653,855 MT or 5.9% of the region's total and valued at 782 million US\$ or 5.6% of the region's total, Malaysia at 240,133 MT or 2.2% of the region's total and valued at 463 million US\$ or 3.3% of the region's total, Lao PDR at 64,300 MT or 0.6% of region's total and valued at 91 million US\$ or 0.6% of the region's total, and Cambodia at 39,720 MT or 0.4% of the region's total and valued at 62 million US\$ or 0.4% of the region's total. The lowest production was reported by Singapore at 3,518 MT or 0.03% of the region's total, valued at 9 million US\$ or 0.06% of the region's total, while Brunei Darussalam reported its production at 390 MT or 0.003% and valued at 392,000 US\$ or 0.002% of the region's total.

4.1 Mariculture

Out of the region's total production from mariculture of 4,646,146 MT or 42.0% of the region's total production from aquaculture in 2008 valued at 2,994 million US\$ or 21.3% of the region's total value of its aquaculture production, Gracilaria seaweed provided 2,145,060 MT or 46.2% of the region's total production from mariculture with Indonesia contributing the highest production. The second mariculture species with the highest production was marine fishes nei (Osteichthyes) at 2,107,787 MT or 44.2% of the region's total mariculture with the Philippines accounting for the highest production of 2,096,639 MT or 99.5% of the species group's total production, followed by green mussel (*Perna viridis*) at 211,275 MT or 4.5% of the region's total with Thailand contributing the highest production of 201,552 MT or 95.4% of the species group's total production.

In terms of value, marine fishes nei (Osteichthyes) accounted for the highest mariculture valued at 1,508 million US\$ with Indonesia contributing the highest value for the species group. This was followed by the grey bambooshark (*Chilocylium griseum*) at 193 million US\$ with Myanmar contributing the highest value of the species group and marine molluscs nei at 170 million US\$ with which Vietnam contributing the highest value of species group.

4.2 Brackishwater culture

In 2008, the total production from brackishwater culture was 2,072,026 MT or 18.7% of the region's total production from aquaculture, valued at 3,473 million US\$ or 24.8% of the region's total. Production of the whiteleg shrimp (*Penaeus vannamei*) was highest at 524,300 MT or 25.3% of the region's total production from brackishwater culture with Thailand contributing the most at 485,700 MT or 92.6% of the species group's total production and reported value of 190 million US\$. The giant tiger prawn (*Penaeus monodon*) accounted for the second highest production at 382,031 MT or 18.4% of the region's total production from brackishwater culture, of which Vietnam contributed 317,600 MT or 83.1% of the production of the species group and valued at 1,357

million US\$. The third highest production came from the Indian white prawn (*Penaeus indicus*) at 217,470 MT or 10.5% of the region's total production from brackishwater culture with Indonesia contributing the highest production of 207,470 MT or 95.4% of the total species group production and valued of 1,370 million US\$.

4.3 Freshwater culture

The total production from freshwater culture in 2008 was 4,345,762 MT or 39.3% of the region's total production from aquaculture. Vietnam contributed the highest production at 1,918,300 MT or 44.3% of the region's total production from freshwater culture. The second major producer was Indonesia with 786,386 MT or 18.2% of the region's total freshwater culture production then followed by Myanmar at 605,552 MT or 14% of the region's total production from freshwater culture. Pangas catfish (*Pangasius pangasius*) contributed the highest production among the species group at 1,257,844 MT or 28.9% of the region's total freshwater culture production all total with Vietnam contributing the highest production of 1,250,000 MT or 99.4% of the total production of the species group. The second highest species produced was freshwater fishes nei (*Osteichthyes*) at 620,456 MT or 14.3% of the region's total production from freshwater culture with the Philippines contributing the highest production of 311,059 MT or 7.2% of the total species group. Roho labeo (*Labeo rohita*) followed with production of 435,505 MT or 10.0% of the region's total production from freshwater culture, of which Myanmar had the highest production of 433,130 MT or 99.4% of the total species group.

In terms of value, the collective total for the region's freshwater culture was 4,716 million US\$, of which Vietnam accounted for 2,656 million US\$, 1,398 million US\$ from Indonesia, 462 million US\$ from Thailand, 387 million US\$ from the Philippines, 141 million US\$ from Myanmar, 124 million US\$ from Malaysia, 91 million US\$ from Lao PDR, 57 million US\$ from Cambodia and 1 million US\$ from Singapore. No corresponding values were reported by Brunei Darussalam.

5. Fishing gear analysis

An analysis of the fishing gear used in the region in 2008 was focused on the three countries that reported their respective production from marine capture fisheries by type of fishing gear. The most prevalent gear used in Malaysia was trawl with total production of 703,453 MT or 51.1% of the production from all types of gears, of which trash fishes comprised the highest production by trawl at 269,710 MT or 38.3% of the trawl's total production. This was followed by purse seine at 391,352 MT or 28.4% of all types of gears, where Scad nei (*Decapterus* spp.) comprised highest catch production by purse seine at 89,794 MT 22.9% of the purse seine's total production. The gill net came third with production of 149,135 MT or 10.8% of types of gears, of which the *Rastrelliger* mackerel (*Rastrelliger* spp.) reported a production of 52,942 MT or 35.5% of the gill net's total production.

Myanmar reported that its highest catch production in terms of gear was by the purse seine at 139,339 MT or 57.4% of all types of gears, of which hilsa (*Tenualosa ilisha*) showed the highest catch production by purse seine at 115,197 MT or 82.7% of the purse seine's total. This was followed by trap at 57,766 MT or 23.8% of all types of gears, hairtail nei (*Trichiurus* spp.) reported

the highest catch production by trap at 40,317 MT or 69.8% of the trap's total production. Singapore reported that its highest production by gear catch was from the trawls at 1,411 MT or 86.9% of all types of gears, of which the penaeid shrimp nei (*Penaeus* spp.) gave the highest production of 132 MT or 80.2% of the trawl's total production.

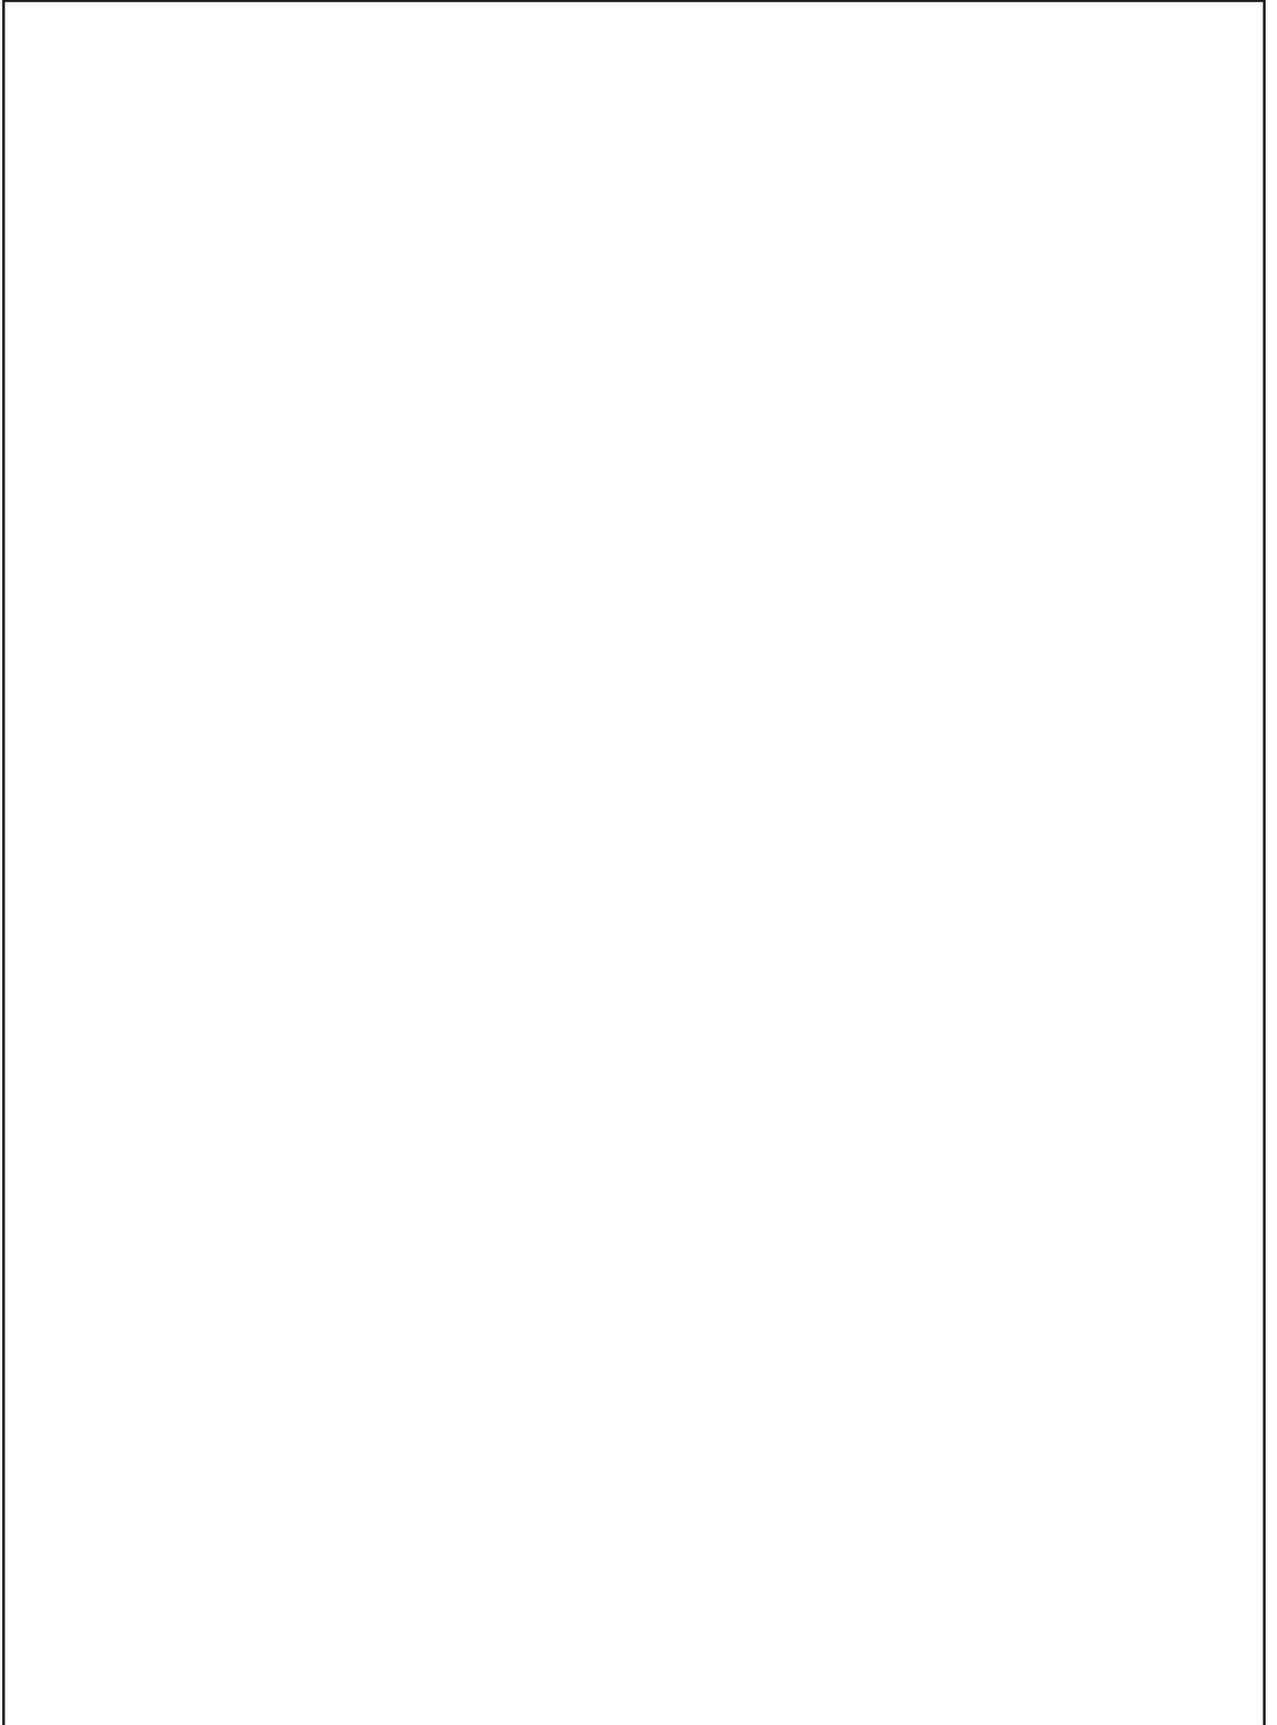

However, it should be noted the abovementioned data for gear used in marine capture fisheries could not be properly analyzed as several countries such as Brunei Darussalam, Cambodia, Indonesia, Lao PDR, Philippines, Thailand and Vietnam did not provide any information.

6. Number of Fishing Boats by Type and Tonnage

The figures included in this section cover only the boats that were registered in each nation, Cambodia, Lao PDR and the Philippines did not report the number of their fishing boats for 2008. By far Indonesia reported the highest number of boats at 604,847 of which 252,515 were non-powered boats and 352,332 were powered, followed by Malaysia with 40,959 of which 2,992 are non-powered boats and 37,967 are powered boats. The third highest number was reported by Myanmar with 31,371 of which 15,219 were non-powered boats and 16,152 which were powered. Vietnam reported that its total number of boats was 22,529 followed by Thailand at 12,920 which were all powered boats while Brunei Darussalam reported its total number of boats at 3,184 of which 305 were non-powered boats and 2,879 were powered while Singapore reported that its total number of boats was 142.

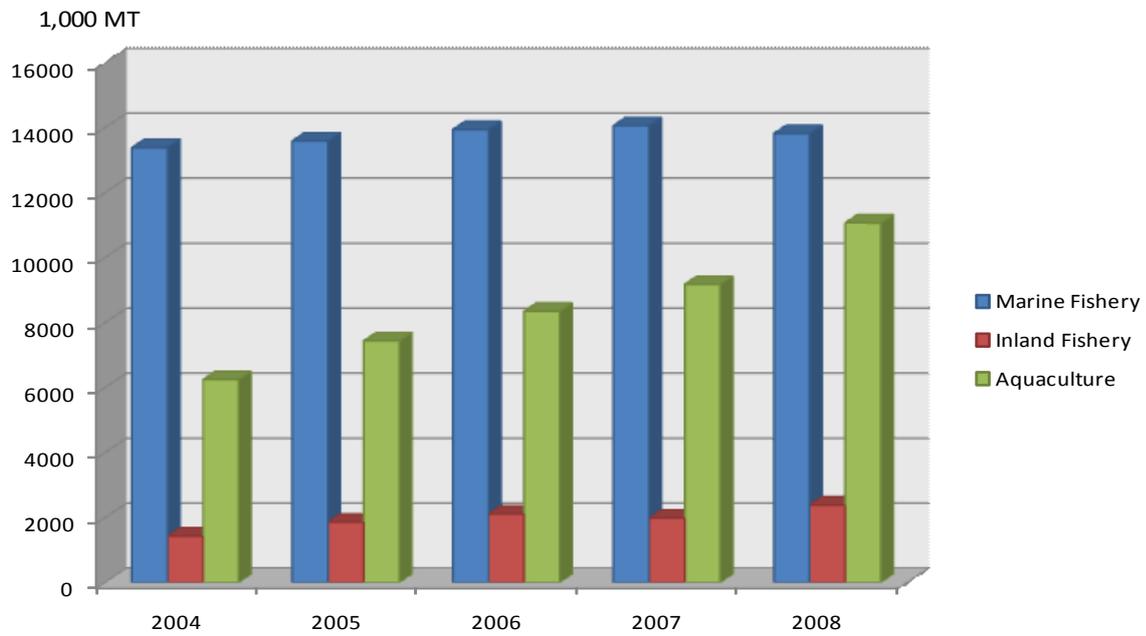

7. Number of Fishers by Working Status

In 2008, Myanmar had the highest number of fishers at 3,201,923 of which 1,429,800 or 44.6% were involved in marine fishery including 244,000 full-time and 262,000 part-time fishers. In inland fishery, the country had 1,574,000 fishers or 49.1% including 489,000 full-time and 300,000 part-time fishers. The country's aquaculture had 198,123 fishers or 6.2% including 154,026 full-time fishers. Malaysia had 140,358 including 109,771 fishers in marine fishery and 30,587 in aquaculture. Brunei Darussalam had 5,229 fishers of which 1,191 were full-time and 4,038 part-time fishers. Cambodia, Indonesia, Lao PDR, the Philippines, Singapore, Thailand and Vietnam did not provide information on their respective number of fishers.
